JOINERY WORKS,

Clapham Junction, S.W.

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

AFTER fifteen years of service with the London and Lancashire Fire Insurance Company, Mr. W. P. Reynolds, the London secretary, has decided to retire, and the directors have accorded him a liberal pension. Mr. Reynolds's successor will be Mr. Joseph Powell, of Liverpool. Mr. Powell commenced his insurance experience with the Imperial, and has been for the past ten years Liverpool secretary to the Scottish Union and National. He has also during the past two years held the office of chairman to the Liverpool Fire Salvage Association. We understand that this change will take place as from May 1 next, and the title accorded to Mr. Powell being that of London manager, Mr. J. P. Read, hitherto assistant secretary, will now become London secretary.

TRADE NOTES.

THIS secluded hamlet, Eryholme, Croft, near Darlington, which is about three miles from Croft, the nearest railway station, North Yorkshire, has had a valuable present in the shape of a public clock, striking the hours and showing the time upon one external dial, fixed at the Mission School, which will be a benefit to everyone in the district, the necessary funds having been got by Mrs. Stewart, the wife of the vicar of the parish, and Miss Scurfield, of Hurworth-upon-Tees. The makers are Messrs. Wm Potts & Sons, clock manufacturers, of Guildford Street, Leeds, the makers of the Richmond, Catterick and Hurworth Church clocks, and many others in the neighbourhood.

THE Clayton Hospital, Wakefield, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke flues, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE designs and estimate of Mr. Louis Harper, engineer, Aberdeen, have been accepted for the supply of three ornamental steel-rope suspension footbridges, to be erected across a stream in the Duke of York Public Gardens, Grimsby.

At the meeting of the Badenoch district committee of Inverness County Council, held in Kingussie yesterday—Mr. D. Grant, solicitor, Grantown, presiding—tenders for the erection of a new iron bridge over the Spey at Kingussie, to replace the present timber structure, were opened and considered. There were thirteen offers from leading firms in Scotland and England. The probable estimate for the work was 3,500l., and the average of the tenders came to within a few pounds of that amount. After a long discussion it was decided to delay accepting offers until next meeting, when the surveyor would submit plans and estimates for a timber and iron bridge on an entirely new site, a feeling having been expressed in favour of altering the site so as to save an outlay of several hundred pounds in constructing a long timber footbridge on the north approach, so as to make the roadway, which in flood time is frequently impassable, available at all times.

UNDER date of February 21, 1894, Mr. John Tann, 11 Newgate Street, E.C., has received the following letter from Messrs. Fred. Anthony Horle & Co.:—"We had the burglars at our offices last Friday night, and they left a letter (now in the hands of the police), saying that they tried to open our safe (your 'Anchor Reliance') for three hours, but could not do it."

"SPHINX" PORTLAND CEMENT.

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1½ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving.

"ECLIPSE" PORTLAND CEMENT. Quick-setting; test, 8 parts. Standard Testing Sand, 230 lbs. per square inch; 28 days. The finest, most plastic, best sand-carrying and cheapest Cement in the market.

Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c. Samples sufficient for Practical Tests Free. Manufactured by JOHN BOARD & CO., Dunball, Bridgwater.

READING CASES FOR THE ARCHITECT.
Price 2s.—Office: 175 Strand, London, W.C.

WE hear that Messrs. Ham, Baker & Co., of 13 Grosvenor Road, Westminster, London, S.W., have been appointed sole agents for Ruscoe's patent apparatus for drilling and tapping mains under pressure and inserting ferrule without shutting off or wasting water.

WE have received from Messrs. J. Weeks & Co., of King's Road, S.W., a copy of a long list of valuable testimonials they have received from all directions, praising their patent duplex upright tubular boilers for horticultural purposes.

VARIETIES.

A BAZAAR in aid of the building fund of the new Bromsgrove School of Art, about to be erected on a site in the New Road, adjoining the new Institute, has just been held in the drill-hall. The bazaar was picturesquely arranged in seven half-timbered and straw-thatched cottages, representing an ancient Worcestershire village, and bearing the titles of "Ye Mermaydes," "Ye Gate Hangs Well," "Ye Beehive," "Ye Hare and Tortoise," "Ye Fighting Cocks," "Ye Pig and Whistle" and "Ye Olde Raven" on appropriately-painted signs. The buildings were erected mainly by the pupils of the carpentry class connected with the schools, under the direction of Mr. Turton, the teacher.

THE Mersey Dock Board have confirmed a recommendation of the warehouse committee that an additional pipeline be provided from the Herculeum Dock quay to the new petroleum tank proposed to be erected on the Parkhill Estate, at an estimated cost of 800*l*.

THE Wilmslow Local Board have received a notice from the Local Government Board sanctioning the proposal to borrow the sum of 10,000*l*. for the purposes of sewerage works and outlet in the northern district of Wilmslow as soon as the necessary land has been secured.

THE Scrabster Harbour Trustees have resolved to introduce a water supply to their harbour, at an estimated cost of 1,000*l*., plans for which have been prepared by Mr. Gordon, engineer, Elgin.

THE *Scotsman* says:—Workmen on the farm of Duns Law, Duns, have laid bare an ancient British tomb on the summit of a knoll known as the "Little Law" field. It is of oblong form, with its head to the north-west. The coffin, as well as its massive lid, is composed of old red sandstone, and its

interior measures in length on the north side 45 inches by 43 inches on the south side, and breadth 29 inches at the head by 23 inches at the foot. The depth is about 20 inches. The joints had been carefully filled in with puddled clay.

THE *Manchester Guardian* says:—The proposal to construct a line of railway from Acre and Haifa, on the Mediterranean coast of Syria, to Damascus is of much interest to Lancashire. The bulk of the present import trade now enters Syria through Beyrout, where the harbour tolls are onerous and landing charges excessive, as well as unequal, as French goods enjoy there an advantage in these particulars. The goods so imported to Syria all find their way to Damascus, the great collecting and distributing centre, and, having to be taken at present over two mountain ranges, the carriage is both slow and costly. The proposed railway will not only carry imports more expeditiously and at a much cheaper rate to Damascus, but will also do much to develop the intervening country through which, for a distance of 150 miles, its trains will run.

THE annual general meeting of the London and Lancashire Fire Insurance Company will be held at noon on April 26, at the Law Association Rooms, Cook Street, Liverpool.

THE Norton Local Board propose purchasing Ivy House, and fitting it up to serve as public offices.

Bric à Brac says a pretty souvenir of the penny postage jubilee has been issued by Mr. J. W. Palmer, in the shape of a photograph of the post-offices of the year 1790 and as they will be in 1990, as they were represented at the conversazione at South Kensington Museum on July 2, 1890. The photograph measures 6 inches by 4½, and is mounted on a thick cardboard. A portrait of Mr. Palmer is given in the picture, which is published at the price of one shilling.

THE sum of 1,000*l*. has been placed by the Goldsmiths' Company at the disposal of the governing body of the Imperial Institute, for fitting up and equipping its department of scientific and practical research, which is to deal with the investigation and practical valuation of new and little-known natural products received from India and from the colonies comprising the empire.

THE *Standard* says:—The will dated 1885, but executed in 1887, of Mr. Ford Madox Brown, late of St. Edmund's Terrace, Regent's Park, formerly of Victoria Park, Manchester, artist, who died on October 6, 1893, aged seventy-two years, has been proved, with personality under 1,000*l*.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

ELECTRICAL.

THE Folkestone Corporation have approved of a scheme for the installation of electric light at a cost of 35,000*l*.

THE following are the contractors for the supply of cables in connection with the Edinburgh Corporation's electric-lighting scheme:—Unarmoured cable, Henley's Telegraph Works Company, Limited; arc lighting cable, Indiarubber Works Company, Silvertown; armoured cable, Siemens Brothers. Mr. Monkhouse is the resident engineer.

THE Isle of Man Tramways and Electric Power Company, Limited, issue a prospectus wherein they ask for capital to the amount of 175,000*l*. for the purpose of extending the present Douglas Bay Tramway to Groudle Glen and to Laxey, with electricity as the motive power. The electrical plant machinery has been constructed and placed in position.

THE death is announced of M. Paul Jablochhoff, the Russian electrician and the inventor of the Jablochhoff candle. The deceased, who was an officer in the Russian army, was the first to solve the problem of dividing the electric light in a satisfactory manner. His system of electric lighting has been used in several cities of Europe.

BUILDING AND BUILDERS.

IT is proposed to build baths for Burslem, and Mr. F. Bettany, borough engineer of Burslem, has paid a visit to Bootle to inspect the public baths there, with a view to making the baths at Burslem as perfect as possible.

A LANDSLIP has occurred at Warden Point, Isle of Sheppey, a strip of cultivated land falling down the cliffs into the sea. A considerable quantity of land is lost annually in Sheppey through landslips.

AT the meeting of the Darlington Town Council the report of the technical instruction committee, which proposed to build a technical institute at the cost of 13,685*l*., including furnishing and land, the building itself taking 9,200*l*. of this amount, was adopted.

AT the meeting of the Leeds City Council it was decided that 2,280*l*. be granted to the markets committee for the roofing over in wood and glass of five alleys in the Kirkgate Open Market.

WORKMEN'S DWELLINGS IN CHESTER.

A REPORT has been issued to members of the Chester Town Council by the public health committee in reference to housing of the working classes in the city. The committee have not recommended the adoption of part three of the housing of the Working Classes Act, 1890, because the necessity for so doing, they say, has not been made apparent. The part of the Act in question they view as an enabling power to be exercised with extreme prudence and caution, and only in the event of clear proof of need, and that private and commercial enterprise are not likely to supply it. They have no reason to consider such conditions prevail. They are of opinion that the supply will meet the demand, and they hold it should be a cardinal principle in administering money drawn from rates that it should not be applied in competition with those who pay the rates—except in cases of absolute need, and its being manifest that the accommodation was not, and would not be, otherwise provided; nothing in the opinion of the committee would justify a corporation taking a course calculated to deter building enterprise, and to bring down the values and rents of their ratepayers' properties, by means of rates drawn largely from them. It rather seemed to the committee to be the duty of the Corporation to stimulate and facilitate by all the means in their power the providing of any needed accommodation by builders, investors and property owners. This had been done. As recently as last February, two large houses having been made into one, and adapted by the owners at a considerable cost, were licensed as a lodging-house for 67 persons. Though it be true that, through the action of the committee, for several years past, in reference to insanitary dwellings, principally in courts and entries, a number of such dwellings had been closed, it was equally true that a considerable number of cottages, fulfilling modern sanitary conditions, had been erected within the municipal boundary, while a greater number had been provided within the Parliamentary boundary and in the immediate suburbs, all of which were within easy reach, and were perhaps in many respects preferable to lodging-houses or cottages in the more densely populated municipal borough. The procedure under this part of the Act involved satisfying the Local Government Board, after holding a public inquiry; and it was provided that any person who, or whose wife or husband, while tenant or occupier of any municipal lodging-house, or part thereof, received poor-law relief, other than relief granted on account only of accident or temporary illness, should be turned out.

THE "METALLO-KERAMIC" JOINT.

A PERFECT joint to connect earthenware closets to metal pipes has long been needed. Subject to correction, we believe that several have studied how this could be accomplished, but without succeeding. Messrs. Doulton & Co., however, have solved this problem in the production of their patent "Metallo-Keramic" joint. We lately had an opportunity of inspecting the "Metallo-Keramic" joint at Messrs. Doulton & Co.'s show-rooms, Albert Embankment, Lambeth, and can safely say that their study and endeavours to produce a perfect joint has been crowned with success. To say that the invention is better than other methods of connecting metal and earthenware would convey a wrong idea, for as far as memory serves us we have

not before seen any system that has been successful. Messrs. Doulton & Co. have given serious study to the subject of jointing closets of earthenware to metal pipes, a most important matter from a sanitary point of view, as well as from other points of view too obvious to require detailing. Some of the difficulties we may allude to by mentioning that

hitherto it has been the custom to bring up the pipe to the floor level, taft the lead over, and make the connection with red-lead putty or other bedding, screwing the closet down to the floor. While it is possible, with due care, to make a water-tight joint by this means, it is certain that carelessness or a settlement will involve an escape of sewer gas. Many methods have been resorted to to meet this difficulty, and lead traps have been sometimes adopted, the joint to pottery being on the house side of the trap; but while this overcomes the difficulty of joint, it necessitates the use of a material (lead) which readily becomes coated, and it, moreover, involves an outer

boxed casing, to conceal the trap and the same objectionable joint between the pottery and lead. By the introduction of their patent "Metallo-Keramic" joint Messrs. Doulton have evidently overcome all these difficulties, and an absolutely perfect joint may be made between the outlet and ventilation connections of a pottery closet by an entire incorporation of the pottery and metal at the point of junction—an invention which completely gets over the serious difficulties before experienced. We can also add that most exhaustive tests of the joint have been made in its varying forms during a considerable period; and though only lately introduced, the "Metallo-Keramic" joint is already, we believe, being largely used. The merit of

the invention may be shortly summed up by saying it is proof against the dangers and difficulties that beset previous methods and rendered them unreliable. The showrooms of Messrs. Doulton & Co. will repay inspection, and we took advantage of our visit to look over the excellent display of specialties and wares for which this firm is so well known. Messrs. Doulton & Co. are about to fit up the underground conveniences which are to be constructed in Islington, near the Philharmonic Theatre. This work when completed will evidently be second to none yet carried out in London, not only in good workmanship and handsome materials, but in meeting sanitary requirements even down to *minutiae*. A fine display of plumbing-work in the showrooms indicates the strides made of late years in this important branch of trade.

THE NEW RICHMOND WEIR.

THE new weir at Richmond is now just on the point of completion, and it is expected that some time in June there will be some sort of opening ceremonial. To speak of it as a "weir," says the *Daily News*, conveys only a very imperfect idea of the magnitude of the work, which has been estimated to cost from 60,000*l.* to 70,000*l.*, Richmond and Twickenham having contributed 40,000*l.*, and the balance having been found by the Thames Conservancy. It is in the main a weir of a very ingenious and novel character, though now in its completed form it has the appearance of a handsome iron and stone bridge of five spans. The essential feature of the structure is an elevated platform which runs across the river, and from which ponderous sluices can be lowered or raised. But the unavoidable ugliness of this platform with its sluices has been ingeniously masked by embodying it in a bridge with handsome iron parapets and fine archways.

Of these arches the two end ones have a span of 50 feet. One of these end arches is occupied by a lock 250 feet long and 37 feet wide, considerably the largest on the Thames. Under the other end arch is a boat pass with three sets of rollers. The three central spans are 60 feet wide, and are fitted with the ascending and descending sluices, ponderous structures of wood and iron, 68 feet long and each weighing 32 tons. So long as the river is above half tide these sluice gates will lie up horizontally under the platform, leaving below them an open river course and a clear headway of 21 feet above high-water mark. All the traffic of the Thames will thus be

able to navigate up and down just as under an ordinary bridge, and the lock and the boat pass will not be required. When, however, the current has run out to the point of half tide and the mud banks of the river bed are in danger of speedy exposure, the sluice gates lying horizontally up under the platform will be dropped, turning over into the perpendicular position as they will and plunging low enough into the ebbing tide to dam back the water to a minimum depth of 5 feet 9 inches below high water. The sluices will not go below the surface of the stream nor will they reach the river bed. They will sink low enough to keep the upper river at the required height, the superfluous water passing under them, thus keeping up that scour of the river bed the absence of which was for so many years urged as a reason why a weir at Richmond ought not to be permitted, since it would inevitably result in the silting up of the river. When these three central arches are blocked by the impassable weirs the lock and the boat pass of light craft will of course be brought into operation. Although the sluice gates are so large and ponderous, they will be raised and lowered with the greatest ease. These are counterpoised by weights, just after the manner of an ordinary window-sash, so that two men by means of winches can easily haul them up out of the water and stow them up overhead.

This new bridge has no carriage-way across it, the sluice-gates occupying that central portion of the structure which in an ordinary bridge would constitute the carriage-way. But on each side is a pathway for foot-passengers, reached by flights of steps leading up directly from the river banks. The new structure is quite level, and it rises abruptly from the banks, and is therefore wanting in that natural gracefulness of bridges the approaches of which rise gradually from the adjacent land on either side. This was unavoidable, but it undoubtedly detracts from the beauty of the new work, and it looks at present as though the red brick lock-house on each side will not greatly embellish the general whole. As these, however, are not yet finished, the effect cannot be positively pronounced upon, and now that the five arches are completed and the timbers cleared away the beauty of the main structure cannot be disputed, while the workmanship throughout is of the most solid and substantial character. With the exception of the lock-keepers' houses and a few feet of the lock walls the work is now practically complete, and there is no doubt all will be in readiness for the formal opening between this and midsummer. What the ceremony will be or by whom it will be performed are points upon which at present nothing has been decided.

HEATING BY HOT WATER.*

A SECOND edition of this work has just been issued by Mr. Walter Jones (Jones & Attwood, Stourbridge), which, altogether independent of systems of heating, is well worth the perusal of architects and builders and, for that matter, of all among our readers, the public generally, who are interested in heating matters according to the best methods. In the second edition we find one hundred pages of new matter have been added; the tables have been revised and many useful ones introduced; several articles on high and low-pressure heating, radiators, duplicate boilers, hot-water supply and other matters are new, and these new articles have not been before published in any book on the subject, the author having been induced to do so by the many courteous applications he received to prepare a second edition. Certain specialties are described and illustrated but in subjection to

hours, and is thoroughly reliable. This may be regarded as a proof that this firm pay quite as much attention to small as large requirements, to be furnished at minimum cost with the maximum of efficiency. The little volume, however, should be consulted, as it gives information and suggestions on "the best methods of heating public, private and horticultural buildings," with many other details as to heating and boilers for all kinds of requirements, collected from all available quarters.

THE BROSELEY TILERIES COMPANY, LIMITED.

THE Broseley roofing tiles—of which the above-named company are manufacturers, and whose extensive works have been established over a century—are widely known, and hardness, lightness and fine appearance are aimed at in their manufacture. The same company are large manufacturers also of flooring and glazed tiles, samples of which we lately

the purposes of a monogram on hot-water heating, and the reader scarcely is called on to recognise the merits of the specialties of Messrs. Jones & Attwood, which are so modestly alluded to among those of many others. The little volume of over 200 pages has nearly 100 illustrations, accompanied by numerous tables. The annexed illustration shows the "Desideratum" complete apparatus, a most convenient form of apparatus for heating small greenhouses, coach-houses and other structures. The total height being only 20 to 24 inches, dispenses with the cost and inconvenience of a stoke-hole. It is economic in fuel, occupies a limited space, is low in price, has fuel space sufficient to last ten or twelve

inspected at their London office and showroom, 10 Arthur Street West, E.C. As far back as 1877 the company decided to develop their business in encaustic and geometrical flooring tiles, and with this object they enlarged their works, also laid down improved plant and machinery. Prior even to that they had gained a reputation for flooring tiles, which they had supplied to a number of public buildings as well as churches.

Owing to the increase in this branch of business, the company, to meet demands, erected last year new kilns and warehouses, also laid down additional machinery of the most modern type. They also commenced the manufacture of two specialties, viz. "Diamond" paving tiles (hydraulic), intermediate in price between ordinary quarries and tessellated flooring, and "Vitro-Granito," for tiling of walls and floors.

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

The marl from which these tiles are made is mined at a depth of over 300 feet, and when brought to the surface resembles rock. It is a strong fireclay, and produces a tile of special wear-resisting qualities that rings like metal, combining utility with economy. These tiles, as to patterns, can be varied to any extent. The colours—natural clay colours—are red, buff, light and dark chocolate, grey and granite. The price permits, we are informed, of their even being substituted with advantage for ordinary quarries.

"Vitro-granito" is a tile resembling granite for flooring or dado-work. It can be obtained in various combinations of colour and lends itself to effective treatment. The speckles, which curiously enough permeate the whole body of the tile, is a natural effect, and although protected by patent rights, the company questions if the tile could be produced outside their works, as mixed marl of this character is quite unique. We have recently inspected some dado-work done with this species of tile in the lavatories attached to the new offices at 14 Billiter Street, E.C., the body of the tile being exceptionally hard. The same description of tile (unglazed) for flooring-work has also been recently laid down at Kilburn.

ROUGH-CASTING IN CANADA.

ROUGH-CASTING, or as it is sometimes called, slap-dashing—both words of which are synonymous with the French *hourdage*, rough work, and *ravalement*, having a similar meaning, writes Mr. Fred. T. Hodgson in *Architecture and Building*—is a method of plastering the outside of buildings much used in the northern part of Canada, because of its being durable, cheap and well adapted to keep out cold winds during our long winters. The methods of applying rough-cast and the mixing thereof do not materially differ from the methods adopted in northern Europe or even in the North-Western States, but it is these minor differences, perhaps, that make the rough-casting done in Canada superior, so far as durability is concerned, to much that is done in other parts of the world.

There are frame cottages near the city of Toronto and along the northern shores of Lake Ontario that were plastered and rough-casted exteriorly over forty years ago, and the mortar to-day is as good and sound as when first put on, and it looks as though it was good for many years yet if the timbers of the building it preserves remain good. Rough-cast buildings are plentiful in every province in the Dominion from Halifax to

Vancouver and from Lake Erie to Hudson Bay, and when well built, and the rough-cast properly mixed and properly applied, the result is always satisfactory. It is quite a common occurrence in Manitoba and the North-west territories in the winter to find the mercury frozen, yet this intensity of frost does not seem to affect the rough-casting in the least, though it will chip bricks, contract and expand timber and render stone as brittle as glass in many cases, and the effect on iron and steel is such as may prove dangerous if exposed to sudden and unexpected strain.

In preparing a frame or log building for rough-casting, care must be taken in putting down the foundation. A good stone or brick foundation is, of course, the best, but where rough-casting is intended, stone or brick foundations are seldom used because of their cost, and the builder is compelled to use posts of wood. Here the posts are generally made of white cedar, which has a lasting quality of thirty-five or forty years, if sound when used. The posts are put in the ground from 3 to 5 feet, the deeper the better, as they should be deep enough in any case to prevent frost from forcing them upward. When a sufficient number of posts have been properly placed a line is struck on them the proper height from the ground and the tops levelled off. The sills are then placed—all joints being broken on top of posts—and the whole made level. These sills and all the other timber, scantlings and lumber should be well seasoned, if possible, for the greatest enemy to the plasterer is unseasoned timber; shrinkage of joists, posts and scantling not only breaks the bond of the mortar, but causes great cracks in corners and angles that no amount of pointing or patching can ever make good.

When the frame is up and the rafters on and well secured the whole of the outside should be covered with good, sound, common inch stock pine, hemlock, spruce or other suitable lumber, dressed to a thickness. If put on diagonally so much the better, but this is not absolutely necessary if the rough-casting is to be of the best quality, as will appear hereafter.

When it can be done it is best to get all partitions set in place and lathed, the roof on and all necessary outside finish or grounds put in place and made ready to receive the lath. The carpenter must prepare his finish or grounds for finish to accommodate the extra lath, as the walls will be thickened accordingly.

For the cheaper sort of rough-casting in one or two coats the following method of lathing is employed:—Nail laths on the boarding—over paper or felt, if paper or felt is used—per-

pendicularly 16 inches from centre to centre if 4-foot laths are used, or 18 inches or 1 foot from centre to centre if 3 foot laths are used. The whole surface to be rough-casted will require lathing this way. When done lath as is ordinarily done with No. 1 pine lath, breaking joints every 15 inches. Put five nails in each lath, driving each nail home solid, coat over with mortar, well haired, and that has been made four or more days, smooth and straighten as well as possible with a darby. When done and while yet soft the rough-cast is thrown on it with such force as to drive the pebbles or small stones deep into it. The mixture or dash, as it is called, is composed of fine gravel, clean washed from all earthy particles and mixed with pure lime and water till the whole is of a semi-fluid consistency. This is mixed in a shallow tub or pail and is thrown upon the plastered wall with a wooden float about 5 or 6 inches long and as many wide, made of half-inch pine and fitted with a wooden handle. While with this tool the plasterer throws on the rough-cast with his right hand he holds in his left a common whitewash brush, which he dips into the rough-cast and then brushes over the mortar and rough-cast, which gives them when finished a regular uniform colour and appearance.

For this sort of work the following proportions will answer. To one barrel of prepared gravel use a quarter barrel of lime putty; mix well before using. This may be coloured to suit the taste by using the proper materials, as given further on. It must be understood that the foregoing is the cheapest sort of rough-casting, and is not recommended where more durable but more expensive work is required.

The best mode of doing this work, as practised in the lake district of Ontario, is about as follows:—Have the frame of building prepared as indicated in the foregoing, with partitions all put in and well braced throughout and well secured. Lath diagonally with No. 1 pine lath, keeping $1\frac{1}{2}$ inches space between the lath. Nail each lath with five nails, and break joints every 18 inches. Over this lath again diagonally in the opposite direction, keeping the same space between the lath and breaking joints as before. Careful and solid nailing is required for this layer of lathing, as the permanency of the work depends to some extent on this portion of it being honestly done. The mortar used for the first coat should have a good supply of cow's hair mixed in with it, and should be made at least four days before using. The operator must see to it that the mortar be well pressed into the key or interstices of the lathing to make it hold good. The face of the work

must be well scratched to form a key for the second coat, which must not be put on before the first or scratch coat is dry. The mortar for the second coat is made in the same way as that required for the first coat, and is applied in a similar manner, with the exception that the scratch coat must be well damped before the second coat is put on, in order to keep the second coat moist and soft until the dash or rough-cast is thrown on. The rough-casting is done exactly in the same manner as described for the cheaper sort of rough-cast work.

A building finished in this manner, if the work is well done, possesses many advantages over the ordinary wood-covered structure. It is much warmer, being almost air-tight so far as the walls are concerned. It is safer, as fire will not eat its way through work of that kind for a long time. It is cleaner, as it will not prove such a harbour for insects. It may be made as handsome as desired, for, before the rough-cast is dashed, it may be laid off in panels of any shape by having strips of battens tacked over the soft mortar, which may be removed after the rough-casting is done and the colouring finished. It is much superior to the so-called brick veneered house, as it is warmer, more exempt from fire and cheaper.

For 100 yards of rough casting in the manner described the following quantities will be required:—1,800 lath, 12 bushels of lime, $1\frac{1}{2}$ barrels best cowhair, $1\frac{3}{4}$ yards of sand, $\frac{3}{4}$ yard of prepared gravel and 16 pounds of hot cut lath nails, $1\frac{1}{4}$ inches long. The gravel should be sifted through a half-inch mesh screen, and should be washed before mixing with the lime putty.

To colour 100 yards in any of the tints named herewith use the following quantities of ingredients:—For a blue-black mix 5 lbs. of lamp-black in the dash. For buff use 5 lbs. of green copperas, to which add 1 lb. of fresh cow manure, strain all and mix well with the dash. A fine terra-cotta is made by using 15 lbs. of metallic oxide mixed with 5 lbs. of green copperas. A dark green colour is made by using 5 lbs. of green copperas and 4 lbs. of lamp-black. Many tints of these colours may be obtained by varying the quantities given. The colours obtained by these methods are permanent; they do not fade or change with time or atmospheric variations. Many other colours are used, but few stand like the ones named. A brick colour may be obtained by the use of Venetian red and umber mixed in whisky first and then poured into the dash until the proper tint is obtained. In time, however, like all earthy pigments, these colours fade and have a sickly appearance; they answer better in cements than when incorporated with fat limes.

ITALIAN BUILDING SOCIETIES.

THE report drawn up by Mr. Geoffrey Drage on the Labour Question in Italy contains the following account of the co-operative societies for building, letting and selling dwelling-houses, which enable workmen to supply their own demand for cheap lodgings:—

The importance of sanitary questions is beginning to be recognised in Italy, and much has been done, especially in the great cities, to improve the construction, ventilation and lighting of dwelling-houses. Many old houses have been pulled down and replaced by larger and better buildings, but the conditions under which the poorer classes live are still far from satisfactory. When old and insanitary buildings are cleared away there is a tendency to fill up their places with larger mansions, which can be let for good rents to the richer citizens. The poor, driven from their former homes, crowd into the cheaper quarters of the town, which are already fully populated. The sudden increase in the demand for lodgings raises rents here also, and leads to overcrowding. Even where new houses are constructed with a special view to the requirements of artisans, they are often the work of speculators who build carelessly and in unhealthy situations, and demand exorbitant rents from their tenants.

Under these circumstances the institution of co-operative house-building societies promises to be a common benefit, justifying the stress laid upon this subject by the Congress of Cremona, 1892.

As yet, however, the movement is only in its infancy. In 1888 there were not more than 63 co-operative house-building societies in the whole of Italy, and by 1890 the number had only risen to 69, including 59 recognised and 10 unrecognised and autonomous associations.

The most common form of building society in Italy is that in which operatives or persons belonging to other classes, credit associations (especially savings banks and peoples' banks), benefit societies, or public companies (*amministrazioni*), combine to take up one or more shares in an association for building artisans' dwellings. Each member, whether an artisan or not, must take not less than one share, and not more than 100 or 200 shares, which are paid up by weekly or monthly instalments. As the capital thus collected would not suffice for the purposes of the society, the administrative council is empowered to contract loans, which are often granted on easy

terms by the local savings bank or peoples' bank. All the funds of the society must be employed in building houses, and as the houses are finished they must be either let to working members of the society or sold to them on a system of payment by instalments, by which the debt is paid off in a period varying from twenty to thirty years. The annual profits, after a certain portion has been placed in the reserve fund, are divided among the shareholders. The dividends on the shares are limited to the interest on the paid-up capital, and the profits of the business are so small that but few dividends are declared. The societies try rather to favour the operatives than the shareholders. They do their utmost to sell their houses at low prices, or let them at moderate rents. A distinctly philanthropic element enters into these associations, since they often receive free grants of land and pecuniary help from the communal authorities, and since also they admit members who do not derive any advantage from the society, but join it from purely disinterested motives. A typical example of this class of association is the building society founded at Milan in 1879 by the *Consolato operaio*, with the immediate object of buying or building a house for its own offices. This was effected in the same year by the purchase on credit of a house in the Via Pesce. A more extensive scheme for providing the working members with dwelling-houses was inaugurated by the purchase of a piece of ground in the Via Conservatorio. A loan of 50,000 lire was negotiated on favourable terms with the local peoples' bank, and twenty cottages were built, some with two and some with four rooms, and were at once let to artisan members of the society. In 1883, the society bought from the State more than 100,000 square metres of land at Porta Vittoria. For this building area it paid 270,120 lire, in thirty annual instalments, with a sliding scale of interest at the rate of 5 per cent. The house in the Via Pesce was sold and another was bought in the Via Crocifisso. To effect these various purchases a second loan of 100,000 lire at 4 per cent. was obtained from the peoples' bank. In a few months plans were prepared for building a model artisan quarter at Porta Vittoria, with cottages for single families, to be sold to members on a system of payment by instalments (*ammortamenti*), three-storeyed houses to be let in flats to the poorer members, gardens, public baths, and shops and warehouses for the co-operative stores. The rules of the society were relaxed in order to allow these houses and apartments to be let as well as sold, and also to admit public and private employés to a share in the benefits which were primarily

PROOF IMPRESSIONS of the BEAUTIFUL ART PLATES which appeared in the New Year's Double Number of "THE ARCHITECT," and in the Number for January 10, 1890, THE TOILERS OF THE DEEP. Two Tinted Ink Photographs (size 18½ in. by 13½ in.), may now be obtained, price 1s. each. Free by post, carefully packed in patent roller, 2s. 3d.—GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

intended for artisans only. Adverse circumstances prevented the scheme of 1883 from being carried out according to the original plans, which were, perhaps, rather too utopian in conception. The Peoples' Bank and the Savings Bank of Milan came to the assistance of the building society in its difficulties. The Peoples' Bank granted a loan of 300,000 lire at 3½ per cent. interest, which was spent in settling the most pressing debts, among them the debt to the State for the land on which the houses were built. The Savings Bank decided early in 1884 to expend a sum of 80,000 lire in buying shares in the society, and since the statutes would not allow anyone to hold more than one hundred shares, the bank made over the stock thus acquired to the society itself, stipulating only that the interest upon it should be devoted in perpetuity to the interests of the inhabitants of the co-operative houses, rewarding meritorious workmen and helping those who were in distress through no fault of their own. With these resources and with the price of some land which was sold, the buildings were carried on and the artisan quarter at Porta Vittoria was begun, though on a more modest scale than had been originally proposed. By the end of 1886 the society possessed two houses in the Via Crocifisso, worth 190,000 lire, one lodging-house in the Via Campo Lodigiano, worth 80,000 lire, twenty cottages in the Via Conservatorio worth 90,000 lire, a group of [twenty-six cottages at Porta Vittoria of the value of 120,000 lire, and another group of twenty-five cottages in course of construction at the same place which were valued at 110,000 lire. There was also a lodging-house with 138 rooms near these cottages which was worth 190,000 lire. In all, the buildings represented a value of almost a million lire, and the society still held land which had not been built over worth 200,000 lire. In 1887 and 1888 the society entrusted the building of two more groups of cottages at Porta Vittoria to the Co-operative Society of Masons. The unoccupied building area at Porta Vittoria had been reduced at this period to 3,000 square metres, owing to the various sales and cessions made to the commune of Milan for roads. The society, however, had made good this reduction by buying 2,000 square metres of land outside Porta Sempione and Porta Magenta. At the end of 1889 the balance-sheet of the society showed, in round numbers, a debit account of 746,000 lire, of which 400,000 lire were represented by real property and 297,000 lire by grants on credit to the inhabitants of the society's cottages; the credit account at the same date amounted to 317,000 lire, including a balance of 110,000 lire from the loan negotiated in 1883 with the People's Bank. The difference of 429,000 lire represented the total net capital of the society, of which 188,750 lire had been paid up. The extraordinary reserve fund, formed with the profits arising from the sale of land outside Porta Vittoria, amounted to 181,000 lire. In 1889 a dividend was declared of 3 lire per share, representing 6 per cent. on the paid-up capital, though the statutes of the society forbade a dividend exceeding 5 per cent. The value of the shares had, however, been fixed for new members at 80 lire instead of at 50 lire. The houses built by the Milanese society are of two kinds. Cottages for separate families, with two or four rooms and a small kitchen garden, and large four-storeyed lodging-houses. In 1890 there were 101 cottages in all, of which fifty-two had two rooms, forty-two had four rooms, five had six rooms, one had eight, and one had three rooms. There were also the two houses in the Via Crocifisso and the lodging-house outside Porta Vittoria and in the Via Campo Lodigiano. A report appended to the balance-sheet for 1886 states that each of the four-roomed houses in the Via Conservatorio cost the society 5,200 lire, while each two-roomed cottage cost 2,600 lire. The members could obtain a four-roomed cottage for an annual payment terminating in twenty-five years of from 305 lire to 320 lire, according to size. The annual payments for the two-roomed cottages ranged from 150 lire to 160 lire, and lapsed also at the end of twenty-five years. The cottages with larger rooms and gardens which were built outside Porta Vittoria cost on an average 1,400 lire per room. They were let to the members on condition of paying up the principal by instalments, with interest at the rate of 4½ per cent. per annum.

The Anonymous Co-operative Society for the construction of Artisans' Dwellings at Verona was established in 1887, on the same principles as the society at Milan. On December 31, 1889, the paid-up capital of this society amounted to 53,785 lire, and it possessed an untransferable reserve fund of 19,716 lire, arising chiefly from a donation made by the Commune of Verona out of a fund which the local savings bank had devoted to promoting the building of artisans' dwellings. It had also a second reserve fund of 600 lire formed out of the accumulated profits. The society bought 30,000 square metres of land in 1887 for a sum of 19,000 lire. By the beginning of 1890 it had built twelve houses, some for single families with two storeys, a separate entrance and a garden; others, three-storeyed, and large enough to lodge three families, with four, five, or six rooms each. None of these houses had been sold, but they were all let to workmen or employés earning less than 1,600 lire per annum, at rents varying from 13 lire to 25 lire per month.

The Co-operative Society for building cheap Artisans' Dwellings at Lonigo is formed by shares which give the holders a right to a dividend not exceeding 5 per cent. This society affords an instance of a special kind of intervention on the part of the communal administration, other examples of which are to be found among the associations in Romagna. The commune granted 6,000 lire to the society for purchasing building land. It also bound itself to pay annually for thirty years a premium equalling 1 per cent. on the sums invested in the construction of the houses. The Lonigo Society was started in 1885 by the local People's Bank and the Working Men's Agricultural Benefit Society. By 1890 it had acquired 1,210 square metres of land, on which it had built a group of fifteen houses of three different kinds, including (1) ten houses with three rooms one above another with a courtyard, each of which cost 1,833 lire; (2) two houses similar to the former, but with the addition of a stone staircase valued at 2,062 lire each; (3) three houses with two rooms on the ground-floor, two on the first-floor, and a granary, each worth 2,519 lire. The houses of the first class were let for 120 lire per annum, those of the second class for 140 lire and those of the third class for 180 lire per annum. No house could be sold without the permission of the society.

The Anonymous Co-operative Society for building Artisans' Dwellings at Lugo was founded in 1883. It has received much help from private patrons and from the commune, which presented it with a building area of 8,009 square metres, and undertook to give a premium of 15 per cent. on the estimated price of the houses built, besides exempting it for ten years from the communal tax on buildings. By 1890 the society had built forty detached houses, each large enough for one family, which were let to those members who actually earned their living by manual labour, or to those whose wages did not exceed 2 lire 50 centimes per diem. The cost price of houses containing from two to five rooms, with offices, varied from 1,200 lire to 3,562 lire, and the rents were so arranged as to allow the tenants to become owners after [twenty years' occupancy.

The building societies which deviate from the Milanese type fall naturally into two main groups, differing in origin and in character. The Tuscan Associations generally adopt the regulations of the society at Sesto Fiorentino. The capital of this society is unlimited, and is formed of an indefinite number of carati, each composed of fifteen personal shares of 100 lire. Every member must take at least one and not more than three carati. The shares are payable in weekly instalments of 1 lira 50 centimes. The society proposes, as funds come in, to build as many houses as there are carati, and in order to carry on the building with greater rapidity, it is empowered to contract loans. When a house is ready for habitation it is assigned to a member holding one carato, who is bound to pay an annual rent rather above the interest of the capital invested in the construction of the house. The society retains the ownership of each house until all the holders of one carato have been put into possession of a dwelling, after which the society, having settled all its debts, will be dissolved (presumably in about twenty years after its foundation), and the houses will become the property of the members, among whom any balance of funds in hand will also be divided. New members are admitted on paying up all the weekly contributions that have accrued since the foundation of the society with the relative interest. No member can sell his carato without leave, and if he fails to pay what is due from him, his carato is put up to auction, nor does he receive any share of the proceeds of the sale unless they exceed his debt to the society. This provision of the statutes, however, has never yet been enforced, and an amendment is now under consideration in favour of reimbursing the defaulter for all the capital he has paid up. The society at Sesto Fiorentino was founded in 1885. At the end of 1889 it had 69 members, holding 81 carati each of 15 shares. The subscribed capital amounted to 130,500 lire, of which 27,274 lire 50 centimes had been paid up in weekly instalments of 1 lira 50 centimes. Twenty-four two-storeyed cottages, detached and with a small garden plot, had already been built, and six more were in course of construction. Each cottage had an entrance passage, a parlour, a kitchen and two bedrooms. They were assigned to the members by lot, on condition of an annual payment of 150 lire, in addition to the weekly contributions, to be continued till the dissolution of the society, which must take place not more than twenty years after the date of its foundation. This term, however, might be prolonged by a prorogation of the society, if from any unforeseen cause it should be prevented from fulfilling its engagements in the appointed time. The Tuscan group of societies includes the building associations at Prato in Toscana, Florence and Brozzi, and the Working Men's Building Society at Galluzzo, which was founded in 1868, and was about to be dissolved in 1890, having finished its work. In 1868 it numbered 112 members, who paid an entrance fee of 20 lire and a weekly contribution of 1 lira towards their shares. They also engaged to give one day's work, on a holiday, once a month, for the construction of the

buildings, 28 workmen being employed every Sunday. In 10 years 14 four-storeyed houses were to be built, each having eight sets of apartments (*abitazioni*), two on each floor. At the end of the 10 years only part of this scheme had been carried out, and some of the members left the society. By 1887, however, the remaining apartments had been completed, and all debts had been paid off.

The Ligurian group of building associations take the Genoese Anonymous Co-operative Society for the erection of Artisans' Dwellings as their prototype. In this society each member must hold one share, paying annually a sum of 25 lire, 75 lire or 100 lire, according to the class of shareholders to which he desires to belong. The shares are personal, and not more than 1,000 may be issued. As the houses are ready to be inhabited, sets of apartments in them are assigned to the members by lot. From the day on which he receives his apartments the member substitutes for the annual payments towards the shares a yearly rent of 300 lire for the first class of shareholders, 360 lire for the second class and 420 lire for the third class, until the sum total of these payments and the former contributions equals the value of the apartments. The title deeds are not placed in the possession of the member until he has paid up at least 1,000 lire; for the balance, the society holds a mortgage on the property till the payments are completed, when the member enters into full ownership. The society does not pay dividends, and no distinction is made between the various classes of shareholders, since all the houses are exactly alike. Although the regulations of the society appear simple, the distribution of burdens and benefits is decidedly unequal, since those who obtain apartments at an early date have a considerable advantage over the others. An attempt is made to remedy this inequality by an article in the statutes, which provides that the holders of the first half of the shares to which apartments are allotted shall pay a graduated premium to the society, varying from 1,500 lire to 100 lire, according to the date at which the respective apartments were granted out, while the holders of the second half of the shares who have not received their apartments shall be awarded a gradually increasing premium from the society. New members have to pay a sum equal to the capital represented by each of the old shares, with interest from May 12, 1867. This sum may be paid by instalments, but until the whole is paid up the new member is not admitted to his full rights. Voluntary withdrawal from the society is not allowed, but a defaulting member may be expelled. In this case his

share is put up to auction, or his apartments are forfeited. A shareholder may, however, with the society's consent let or sell his apartments. The society will dissolve when all the members have been provided with apartments. The Genoese Society was founded in 1868. At the end of 1889 it had built thirteen houses, occupying an area of 7,300 square metres, and had eight still in hand. The houses were six-storeyed, with 449 sets of apartments, each containing a kitchen, a sitting-room and three other rooms. Four houses had an inner court, eight had a garden, while one had both a garden and a court. The total number of members was 800, of whom 396 had received apartments in 1890. The total capital paid up by the members on December 31, 1889, amounted to 2,687,500 lire. The society had a reserve fund of 258,487 lire, and a "premium fund" of 300,700 lire formed of the premiums paid by the first shareholders who had received apartments. To the Genoese type of building association belong the Anonymous Co-operative Society for the construction of Artisans' Dwellings in Genoa, the Emancipation Co-operative Society at Pegli, and the Anonymous Co-operative Society for the construction of Cheap Houses (*casa economiche*) at San Pier d'Arena. The last-mentioned association, which was founded in 1875, numbered 252 shareholders on December 31, 1889, and had a paid-up capital of 434,136 lire. The members paid 78 lire per annum on their shares till apartments were allotted to them. They then paid 300 lire yearly till the sum total reached the value of the apartments. At the end of 1889 the society had bought 4,282 square metres of land in lots. It had built four large seven-storeyed houses divided into sets of apartments, each with three rooms, an entrance and a kitchen, and 109 sets of apartments were already occupied. The Anonymous Co-operative Society for the construction of Houses in Genoa and a few other associations differ slightly from the Ligurian type in their regulations concerning the payment of premiums by the members, the admission of new members, and the dissolution of the society. The members of both the Tuscan and the Ligurian Associations are chiefly drawn from the middle classes and from the better class of artisans, since the annual contributions are too high to be paid by an ordinary labourer.

Forty-two out of the sixty-nine existing building societies had built at least one house by the end of 1889, five which had been recently founded had just begun to build, ten had not constructed a single house, and of the remaining twelve no details were known.

CONSTRUCTION OF GASWORKS.

At the meeting of the Institution of Civil Engineers on April 3 a paper was read on "The Construction of Gasworks," by Mr. Charles Hunt.

Since Mr. H. E. Jones's paper was read before the Institution in 1875, the consumption in England of coal for gasmaking purposes had risen from 5½ million tons to over 11 million tons. The greater output of gas which these figures indicated had been largely supplemented by conditions due to concentration of manufacture, so that while it might be safely assumed that the majority of gasworks had been doubled in capacity during the last eighteen or nineteen years, it was also certain that in some cases even this rate of growth had been conspicuously exceeded.

In describing the construction of gasworks of the most modern type the author took for his text the Windsor Street Works at Birmingham, recently completed from his designs. There the dominating idea had been unbroken railway communication to the furthestmost point of delivery within the works, the position of the retort-house having been made to subserve this end. In carrying it out two series of curved lines, crossing each other in opposite directions, lead to the retort-houses. These lines were overhead, 20 feet above ground level and 10 feet above the charging-floor of the retort-house, so that coal was stored in the yard to a depth of 20 feet, and in front of the retort to about half that depth by simply dropping it from the railway waggons. Water-carriage was available for the disposal of the coke, which was loaded at a comparatively small cost into boats brought to within a few yards of the retort. Equal facility for loading railway waggons was afforded by a coke-loading dock, 6 feet deep, running parallel with the canal arm. This system had been first adopted at Leicester, where Mr. Alfred Colson had also demonstrated the superiority of an inclined railway worked by a locomotive over a hydraulic waggon-hoist for dealing with any considerable amount of traffic.

In delivering the coal to the retort-house, it was obviously advantageous to reduce the handling to a minimum. Where this could not be done on the level with the railway, it might be effected on the system adopted at the Glasgow gasworks, where an inclined railway of the ordinary gauge had been constructed from the main line siding, rising to the top of the coal stores, 17 feet above the charging-floor of the retort-house and worked by a small tank locomotive. Where soft coal was used,

however, the breaking up which resulted from dropping the coal from a height was an objection. The author cited an experiment made at the Windsor Street Works which showed that not only was the value obtained from a mixture of lumps and dust much less, but that the charge took half as long again to work off. It thus appeared desirable to ease the fall of the coal by an inclined shoot and to select a charging-machine which required the coal to be broken up the least. It might occasionally be found practicable to place coal-breakers at such an elevation as to deliver from them direct into the hoppers, but it was a matter for consideration whether it was not preferable, generally, to choose a low-level for the delivery of coal for daily use, and have recourse to elevators for raising it to the required level. The cost of unloading coal delivered by water was greater than from railway trucks, and there was occasional loss through transhipment; nevertheless, improved appliances at the Nine Elms Works had reduced the cost for labour only from 4d. to 2½d. per ton.

With regard to carbonisation, the author remarked generally that it was perhaps easier to contrive economies with the material in bulk than in detail, as it had to be dealt with in the retort-house, although in the latter case the margin for saving was decidedly larger. How much coal might profitably constitute a charge had never been definitely determined; there was good ground for the opinion that the best all-round results were obtained from small charges combined with moderate as distinguished from very high heats. It had been generally assumed that the deficient yield of tar which usually accompanied the use of a high carbonising temperature was fully made up by increased production of gas. In the author's experience, however, the highest production of gas has been accompanied by the largest yield both of tar and ammoniated liquor. It was also believed that a high yield and consequently high temperature were most productive of illuminating value. Experiments at the Windsor Street Works showed that there was a falling off of illuminating value when very high yields of gas were obtained. While the best general results were to be obtained from carbonising at a fairly high temperature, it was essential that the gaseous products should be enabled to pass freely away and without encountering in the ascension-pipe any absorbent of hydro-carbons such as thick tar. When obstruction occurred to any extent in the shape of stopped pipes—and with high heat this was seldom wholly absent—the loss thus occasioned was likely to turn the scale in favour of a lower temperature.

Much diversity of practice existed as to the shape no less

than the size of the retort. The author favoured the oval shape, as enabling the coal to lie within it in a fairly even layer, as allowing the coke to be more easily drawn than from the ordinary flat-bottomed D, and as being very durable. Some retorts of this type had been under fire continuously at the Windsor Street Works for 1,567 days. Direct firing was, only a few years ago, universal, but the modification of the Siemens system of regenerative firing known as continuous recuperation was being regarded with steadily, almost rapidly, increasing favour. Its chief advantages were a saving in fuel and in labour in attending to fires, and greater carbonising capacity. These three advantages were considered in detail and figures given in support of the author's conclusion.

The influence of condensation on the deposit of naphthalene was generally recognised. Hot or slow condensation, by keeping the gas in contact with the lighter constituents of the tar until a comparatively low temperature was reached, usually resulted within the works in the disappearance of this deposit; it might, however, be doubted whether this remedy was a wholly satisfactory one, seeing that it did not attack the evil at its root. The appearance of naphthalene might be regarded as an indication that all was not right with the carbonising arrangements, and the question arose whether so high a heat as that at which naphthalene was produced was necessary or even desirable for the economical carbonisation of coal.

With regard to washers and scrubbers, much controversy had arisen as to the tower-scrubber. The author was of opinion that in bulk, cost and manageability it left much to be desired. A great improvement had been effected by the introduction of rotary washers, but with these much more driving-power was required than sufficed for working the water-distributor of the tower-scrubber and the wear and tear was greater. Dr. Lunge's "plate-tower" was described, in which a series of perforated plates made of porcelain or earthenware superposed within a cylinder compelled the breaking up of both gas and liquid at every interval between the plates. In a gas-washer devised by the author, of which a description was given, the amount of back-pressure represented the mechanical power it required.

In regard to purification, the terms recently granted by Parliament to the Crystal Palace District Gas Company, under which the maximum amount of sulphur (other than sulphuretted hydrogen) allowed in the gas was fixed at 20 grains per 100 cubic feet throughout the year, marked a departure from the stringency hitherto prevailing in connection

with this subject that might with advantage to the consumer be made more general. The author gave the results of a three winter months' trial of the lime and air process at Windsor Street Works, in which the sulphur compounds were reduced from about 40 to 45 grains per 100 cubic feet to an average of 14.1 grains per 100 cubic feet. The lime used was about 2.45 tons per million cubic feet of gas, the quantity of air admitted at the condensers being from 1 to 1½ per cent., though very much larger quantities were occasionally admitted without increasing the quantity of sulphur compounds. Subsequently, upon the adoption of this process for the whole of the make, the coal having been charged in the interval, the sulphur compounds occasionally rose to over 40 grains, while the lime used was 3.77 tons per million cubic feet. This unsatisfactory state of things lasted until it was found to be largely due to the admission of air. Since then air has been rigidly excluded. Daily tests were made of the amount of oxygen in the gas, and it was almost invariably found that when the oxygen went up the sulphur compounds followed. From this experience it might be concluded, (1) that oxygen, so far from assisting in the removal of sulphur compounds, was actually prejudicial, at all events when present in any appreciable quantity; (2) that it was of use mainly for oxidation of the sulphuretted hydrogen by which economy of lime was effected, and the spent lime, being chiefly in the form of carbonate, with a large percentage of free sulphur, was rendered practically inodorous; (3) that the quantity of oxygen, either pure or as atmospheric air, which might be safely employed, having regard to reduction of sulphur compounds, varied with the CO₂ present, i.e. the less CO₂ the more oxygen. It further appeared that unless air could be almost completely excluded, the lime and air process was less suitable for the removal of sulphur compounds than one in which each impurity was separately attacked.

THE BIRMINGHAM COUNTY COURT.

THE death of the senior Registrar of the Birmingham County Court, after an illness which was attributed to the defective condition of the offices in which his duties were carried out, has drawn attention to the defects of the whole of the Court-house buildings. Mr. Registrar Parry, in course of a conversation with several representatives of the press, said that he felt very strongly about Registrar Cole's death, because it was caused by the draughts and stinks of the court. It was more than ten

J. ATTWOOD.

STOURBRIDGE.

The only Attwood in the Trade.

years since they removed to the present court, which was then a newly-erected building, and was not then fully completed. The water used to stream down the walls of the court. Mr. Cole's good constitution was of use to him, and he managed to bear it without much inconvenience, but that was not the case with others, and he (Mr. Parry) had seen Mr. Alfred Young and other counsel who practised at the court sitting in their ulsters and top-coats, and a motley crew they looked. When the building was being erected the Registrars were consulted, and protested against the system of ventilation, but although their assistance and advice were sought they were entirely disregarded, and the air shafts were placed in the window ledges. The draughts were so bad that the system had to be altered; but he well remembered that a gentleman named Hayes caught a severe cold and died, and it was alleged at the time that his death was owing in a great measure to the draughts that were found in the court. He himself had suffered a martyrdom through it, and he had been away a month at a time through sitting in the draughts and the damp of the court. The Board of Works, with whom they had communicated from time to time, altered the air shafts, and put others in, which made the place a little better. The deceased, who was a younger man than he was, at length began to be affected in the same way he (Mr. Parry) had been affected. He had a series of illnesses, and four or five years ago was compelled to undergo an operation, since which his health had not been so good. Continuing, Mr. Parry said that not only did they have draughts in almost every place in the court, but their own rooms, and Mr. Cole's in particular, had been something frightful. Several years ago, when he had recovered from his illness, the deceased Registrar informed the Board of Works as to the condition of his room, and had a fierce conflict with the man who represented that department. He had often called him (Mr. Parry) into his room, and asked him what he thought about the draughts which prevailed. When he made his complaints the windows were filled up and all sorts of things done to remedy the defect, but still it had been the same always, and, added Mr. Parry, "in my opinion, as I said before, his illness—the serious illness that he has suffered and borne up so bravely against—has to a large extent been caused by the draught and by the stink of the court." Going on to speak of the foul atmosphere of the court, Registrar Parry said that Sir Henry Hancock had suffered from the bad air, and had done his very best to get an alteration effected. He wrote, the speaker believed, some rather energetic letters

to the Board of Works about it, and about a month ago an officer from that department came down and saw Sir Richard Harington and himself. He explained and pointed out to that gentleman what they had to complain of, but they had not yet had a remedy. For the last two or three years the deceased Registrar had had a sort of chronic cough and had never been free from a cold, for no sooner had he got rid of one than he would catch a fresh cold in some room of the court. When they last saw each other the deceased, who was very low-spirited, said, "Parry, I think I am going to die, and you will be senior Registrar. Don't you have my room, or it will kill you."

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 6144. William Willis, for "Improved detachable joint between lead and metal or earthenware pipe."

THE

Architect and Contract Reporter.**SPECIAL NOTICE TO THE TRADE AND OTHERS.**

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

1a CRESCENT, MINORIES, LONDON, E.C.

TRADE NOTES.

WE are glad to learn that the London and Lancashire Fire Insurance Company have had another marvellously successful year, and have just declared a dividend at the rate of 20 per cent. The annual accounts have just been issued to the shareholders. They show a net premium income of 868,138*l.* 14*s.* 9*d.*, and a net credit balance on the year's operations of 26,453*l.* 3*s.* 8*d.* The directors propose to pay the same dividend as for last year, viz. (including the interim), 10*s.* per share, or 20 per cent. on the paid-up capital. The financial position of the company will then stand as follows:—Capital paid up, 212,750*l.*; reserve funds, exclusive of capital, 660,259*l.*; reserve capital at call of directors, 1,914,750*l.* We trust that the company will long continue to enjoy its present prosperity.

THE *Leeds Mercury* says:—Messrs. E. P. Taylor & Co., Littleborough, have secured the contract for the construction of the new line, about 2½ miles, at Poulton, on the main line from Preston to Fleetwood.

THE Aberdeen Town Council have agreed to widen Beechgrove Terrace, at a cost of 824*l.*

THE Gas Trustees of Greenock have resolved to recommend to the Police Board the immediate adoption of the system of manufacturing gas from oil. The initial cost is put at about 1,500*l.*

A LARGE clock, with four 5-foot illuminated dials and striking the hours and quarters, has just been fixed in the tower of the new buildings, Cheetham Baths, Manchester. The work has been carried out for the Corporation of Manchester, under the direction of the architects, Messrs. Booth & Chadwick, Manchester, by John Smith & Sons, Derby, makers of St. Paul's Cathedral clock.

THE *Carlisle Journal* says:—Messrs. Beatty Bros., contractors, of this city, have again secured the War Department's triennial contracts for the whole of the artificers' work at the Castle. This work has now been let to them continuously for twenty years.

WE hear that Messrs. Alfred Williams & Co., hydraulic engineers, 39 Great Eastern Street, E.C., have recently fixed one of their 30-foot diameter "Halliday" direct acting wind-mill pumps over a shaft 130 feet deep, at St. Austell, Cornwall. This machinery is delivering 5,000 gallons per hour into an elevated reservoir, from which the surrounding district is

supplied with water. This firm has also contracts in hand for similar work at Maidenhead, Leeds, Chester, Oxford, and Wickham Market.

IN memory of the late Mr. John Haggas, of Oakbank, a four-dial Westminster quarter chime clock and bells from the factory of Messrs. Wm. Potts & Sons, of Leeds, has been placed in the tower of St. John's Church, Ingrow. The going train is the gift of Mr. Herbert and Mr. Fied Haggas, but the chimes, &c., have been raised by voluntary subscriptions.

VARIETIES.

THE Ripon City Council have adopted a scheme proposed by Mr. A. E. Preston, C.E., of Bradford, for works of sewage purification, intercepting sewers and new main sewers for the city. It is proposed to treat the sewage by intermittent filtration, for which 25 acres of land will be required. Mr. Preston's estimate of cost is (including land, 2,500*l.*) 17,700*l.*

THE collapse of a quarry is reported from Pemberton, Wigan. The men had just concluded operations when the sides of the quarry gave way, and the machinery at the surface was precipitated below and covered with about 7,000 tons of stone and earth. The quarry was worked by Mr. J. Ascroft, and the damage sustained is estimated at 1,000*l.*

VOL. III. of "Cassell's New Technical Educator" has just appeared. It contains nearly 400 pages, which are copiously illustrated. For students this work is a practical repertoire for exhaustive information on every kind of craft and scientific pursuit, besides engineering, building, &c.

WE hear that Dr. Conan Doyle, author of "The Adventures of Sherlock Holmes," is to write a series of articles for *Great Thoughts*.

THE students from the Westminster Technical Institute (which has been formed through the munificence of the Baroness Burdett-Coutts) are invited to visit the Highgate Museum of Sanitary Appliances to-morrow (Saturday) at 3.30, and Mr. T. de Courcy Meade, under whose direction the museum has been formed, has undertaken to briefly address the students.

THE Preston Board of Guardians have passed a resolution protesting against the extravagant expenditure of the Lancashire County Council, and calling upon them to control their expenditure so as to give relief to the oppressed taxpayers of the county.

Price, £1 10*s.* and upwards. Portable Filters on this System, £1 5*s.* to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4*s.* 6*d.* and 6*s.* each. Household and Fancy Filters, from 10*s.* Water-testing Apparatus for detecting Impurities in Water, 10*s.* 6*d.* and 12*s.* each.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

THE purification of the water of Leith, it is said, may cost 250,000*l.* Edinburgh will be responsible for 19-25ths, and Leith for the remainder of this outlay.

THE Local Government Board have empowered the Coventry City Council to further borrow a sum of 2,100*l.* for the new baths.

THE bridges committee of the London County Council have reported that the estimated value of the work executed in connection with the Blackwall Tunnel up to the end of March was 268,773*l.*

A TABLET recording the opening of the Manchester Corporation electric-lighting station has been unveiled by Sir John J. Harwood. The light has been in use in the central part of the city for some months, and the demand for it is so great that an extension of the plant at the generating station is already in contemplation.

THE new bridge over the river Aire at Shipley, in the highway to Baildon, has been opened. At the subsequent dinner Mr. T. M. Holmes, chairman of the Baildon Local Board, proposed the West Riding County Council, and Mr. Waugh, who responded, said the question of expenditure of public money was a very serious matter. It was proposed by the County Council to spend what he believed would run to 100,000*l.* in building offices and meeting-place at Wakefield. If the County Council did elect to spend that money, every man who voted for it he would propose should be admitted to Menston, Wadsley, or Wakefield Asylums, without either doctor's certificate or that of a magistrate.

AT the meeting of the Bedford Town Council a letter was read from the Duke of Bedford, in which he offered to present to the town a field of 22 acres in the vicinity of the Promenade, on the banks of the Ouse at Bedford, for the purpose of providing a public recreation-ground, and enable the Corporation to complete a scheme for the improvement of the spot. The ground was valued last year at 8,500*l.*, when negotiations were opened for the purchase of the land.

THE London Tramways Company, in relaying the trams on the long stretch of road from Church Street, Camberwell, to New Cross Gate, are substituting a solid iron foundation for the rails in place of the wooden sleepers in which they have hitherto been laid. This system of platelaying will obviate the necessity of frequent renewals.

THE public swimming baths at Perth have been presented as a gift to the Town Council.

THE old county gaol for Fife, situated between the Eden and the railway siding at Cupar, has been bought at public auction by Mr. Thomson, banker, for Mr. Watt, seed merchant, Cupar and Perth, at 560*l.*

THE Stamford Town Council have decided to appoint a borough engineer at a salary of 300*l.* a year.

THE tender of Mr. Edmund Gabbutt, Oakes Street, Liverpool, has been accepted by the Corporation for the erection of workshops, stores, offices and other buildings in Pall Mall, Leeds Street and Highfield Street, Liverpool, for the sum of 6,292*l.*

THE Manchester Corporation having sanctioned the paving of several streets in the central portion of the city with wood, the Highways Department, through a sub-committee, have made very careful inquiries as to the best material to be used. Early in March a letter was addressed to the principal corporations, vestries and boards of works in the United Kingdom, which elicited much useful information. An inspection was also made by a deputation of the wood pavements in various parts of London. The conclusion of the sub-committee is that the most suitable kinds of wood pavements to adopt for the Manchester streets are beech (creosoted or otherwise preserved) or Australian hardwood pavements, laid with close joints, and grouted with pitch and tar, and they recommend that experiments be made with both of these classes of pavement in the streets ordered by the committee to be paved with wood.

BUILDING AND BUILDERS.

MESSRS. MARSHALL & SNELGROVE have just opened the first portion of their new premises in Vere Street, and have also in contemplation the reconstruction during the autumn of another part.

THE watch committee of the Liverpool Corporation have approved of plans submitted by the city surveyor as to the proposed alterations and additions to the Central Fire Station and Police-buildings in Hatton Garden, at an estimated cost of 26,000*l.*

THE *Irish Times* says:—Portumna Courthouse collapsed shortly after the conclusion of the business of the Quarter Sessions, conducted by County Court Judge Henn, Q.C. The roof and ceiling fell in, covering the body of the court with debris to the depth of 7 feet. The four walls are intact, being built of solid masonry, but otherwise the building is a wreck. The litigants, lawyers and others who had occupied it just

ALBERT WORKS, ALBERT EMBANKMENT. LONDON, S.E.

before the occurrence had a remarkably narrow escape. The building was of ample proportions, and in internal arrangements superior to what is generally found in provincial towns. The cause of the collapse is attributed to the action of the recent heavy rain in contracting the joists to which the laths of the ceiling were nailed.

A NEW college for the Franciscan order, designed by Messrs. Pugin & Pugin, is now in course of erection at Buckingham. The contractor is Mr. Tibbets, of Buckingham.

THE new church of St. Patrick, Coatbridge, N.B., is to be commenced at once from the design of Messrs. Pugin & Pugin, of London.

THE bricklayers and labourers in the building trade at Portsmouth have demanded an increase of wages. The masters consider that as only twelve months have elapsed since the last advance in pay, the demand is unreasonable.

THE Albert Palace at Battersea is to be sold by auction on May 29. It is in good preservation, and is expected to average a fair price. Mr. Herbert Gladstone, on the part of the Office of Works, is the vendor.

MANCHESTER SHIP CANAL COMPANY.

THE following official statement has been issued by the Manchester Ship Canal Company:—"From the statement submitted to the board on Saturday, the 14th inst., by the chairman of the finance committee, Sir Edward Jenkinson, it appears that the cash balances and other available assets, including the five hundred thousand pounds remaining out of the two million pounds authorised to be lent by the Manchester Corporation under the Act of 1893, amounted on January 1, 1894, to 1,353,482*l.* The following is the forecast of the financial position of the company on January 1, 1895:—"After providing for all works already ordered by the executive committee, including six dock sheds, three storeys high, and twenty hydraulic cranes ordered since the date of the shareholders' meeting in February last, for dredging, for the balance owing on purchases of land, for working expenses, and for interest on all loans for the year 1894, and taking traffic receipts at a low estimate, the sale of plant at only 20,000*l.*, 12,000*l.* having been received since January 1, and without estimating receipts from sales of land, there is a balance of 381,515*l.* Some portion of this balance will probably be expended by the executive committee on further necessary works. The company owns about

2,600 acres of surplus lands, the value of which is already large, and will steadily increase. The value of the plant now available is also very considerable."

BAKER'S PATENT DRIP LUG.

THE above patent drip lug is for rain-water, soil, and other pipes. The drip formation of the lug or ear prevents any overflow running down the pipe from touching or soiling and making damp the wall to which it is fixed, the overflow running down the pipe to the bottom of the same. The projection renders it possible to properly paint behind the pipe, to make secure and accessible soil and other joints, and to paint or cement the wall behind the pipe after fixing. The ears having three nail holes, one of them is sure to enable a nail to be driven into a joint, avoiding the waste of time plugging and splintering brickwork. The holes not used can be puttied up when painting. String-courses and plinths of 2½-inch projection will be cleared without cutting away and damaging the work. No trouble in future with weather tiling. By means of the angle pipe the difficulties of making an effectual joint in soil-pipes situated in corners or otherwise will be thoroughly overcome.

CARPENTERS AND JOINERS.

THE thirty-fourth annual report of the Amalgamated Society of Carpenters and Joiners has just been issued. It appears from the general secretary's remarks that during 1893 56 new branches were opened and 6 were closed, the net increase of members being 3,408. At the close of the year there were 629 branches and 40,996 members. The aggregate income was 109,722*l.*, being 10,898*l.* in excess of the preceding year, whilst the expenditure was 109,441*l.* The assets of the Society are estimated at 79,449*l.*, or 2*l.* 1*s.* 7*d.* per ordinary member. In unemployed benefit, which is a weekly allowance paid to members thrown out of employment through depression in trade, there has been expended during the year 30,508*l.*, which is at the rate of 19*s.* 5*d.* per member, being 5*s.* 9½*d.* per member more than in 1892, but considerably less than in 1885-88, and the remark is made that the maximum has probably not yet been reached before the decrease again sets in. Sick benefit cost 24,511*l.*, the experience of sickness having been exceedingly heavy, a circumstance largely due to influenza. The payment in respect of strikes and lock-outs was 15,904*l.*

HEWETSONS, Tottenham LONDON, W. HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON) — "You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

NOTES ON NOVELTIES.

A NUMEROUS party of electrical engineers and members of the press assembled on Tuesday last at Willesden Junction, in response to the invitation of the directors of the Rollason Wind Motor Company, of 13 Berners Street, W., to inspect a new motor which is designed to utilise the air currents for the production of electricity for lighting purposes and motive power, and which was doing some good work notwithstanding that there was very little wind.

The "Rollason" motor, of which we append a sketch, is quite a departure from the ordinary construction of windmills which are now in use, being of horizontal design or arrangement erected within a skeleton turret. From the top to bottom of the centre or axis of the turret is provided a vertical steel shaft having five concave sails attached, which revolve on radius rollers immersed in oil. On these sails are fixed a number of inclined ridges or planes, which deflect the force exerted by the wind to their peripheries. Between the sails and the shaft is arranged a considerable open space which allows the wind to actuate three sails out of the five at the same time. Outside the sails is a framing supported by six radial or cross arms, which are bolted to a centre bearing which is free to rotate independently of the sails. From the top of this shield a second vertical shaft is continued through the roof of the turret, and to this is fixed a vane, so that when the direction of the wind changes it moves the shield into the correct position for only the concave sides of the sails to catch the wind. On the top of the sail shaft is fixed a cup containing a quantity of oil, within which are rollers by which the shaft actuates the shield. The weight of the vane shaft is carried on an independent roller bearing fixed in the roof of the turret. The whole weight of the sails and framing carrying the shield is thrown to the centre bearings on the bottom of the turret,

which thus gives to the working parts of the motor the desired balance.

The salient advantages claimed for this invention are its simplicity of construction, efficiency in working, and the few working parts which, moreover, are arranged to run in oil so as

to be always lubricated and prevent corrosion. It can, therefore, be left working for a lengthy period without any attention. Its capability of taking up a breeze or accommodating itself to a gale, its ready adaptability for erection on buildings, as the

turret can be built to suit any style of architecture, are further contended features of merit. The motor in question is 20 feet in diameter, is erected on an open iron structure, 30 feet high, and is being used for generating electricity for lighting purposes, producing with twenty-one accumulators 1,500 candle-power, but with additional accumulators, however, it is capable of quadrupling this amount of power. The motor is also equally adapted to the production of power for driving any kind of machinery for which gas or steam-engines would otherwise be used.

There are several automatic arrangements and special features to be noted in connection with the electrical apparatus to which the motor is applied, *e.g.* (1) that for disconnecting the dynamo from the accumulators when the wind drops; (2) that for charging and lighting at the same time; (3) that for stopping the dynamo when the accumulators are fully charged, and for restarting it as soon as any current is used from the accumulators, the object being to let the combined motor and electrical plant work all night and on Sundays without any attention. In factories where motive power is required the electricity generated can be used in the summer or daylight, when no light is required, for driving machinery of various kinds, or for other similar purposes where the electric current or power can be utilised. Obviously the power obtained by the motor can be also employed as a mechanical agent for working pumps or other machinery for water supply. The lightness, cheapness and facility of erection are other advantages claimed for this particular type of wind turbine motor.

THE STRIKE IN VIENNA.

ACCORDING to the correspondent of the *Times* the strike of the Vienna joiners and cabinet-makers, which was decided upon on Monday evening at a meeting held at the Town Hall, and attended by between 12,000 and 13,000 men, began on Tuesday morning. It is calculated that about 12,000 men came out. Their demands are for an eight hours' day, the abolition of piecework, a minimum weekly wage of 10fl., or about 16s. 6d., and the recognition of the First of May as a holiday. The committee of the Employers' Association stated that these questions would be considered at a general meeting of that body on the 25th inst., but on Monday night's gathering of the men this was declared to be merely an attempt to postpone the struggle. The conduct of the latter has up to the

present been exemplary, indicating as it does a high state of organisation and discipline among them, and consequently self-respect and confidence. Another noteworthy feature of the proceedings was the remarkable unanimity and enthusiasm of the men in coming to a decision. Their leaders had submitted the question of a strike to them without expressing any opinion as to what course should be pursued. Indeed, it would appear that there is a stronger inclination to cease work amongst the men than there is amongst the leaders. The present strike includes not only Vienna itself, but some of the outlying districts. A number of carpenters engaged on new buildings went on strike on Monday, their demand being for a minimum daily wage of 2fl. 50kr., or about 4s. A proof of the excellent party discipline maintained amongst them was given next morning by some hundred and fifty men engaged on the buildings of the forthcoming International Exhibition. They threw up their work, notwithstanding the offer of double and triple wages, on the ground that they must stand by their fellows. The architect, who has but a few days more in which to complete the buildings, appealed to the chairman of the strike committee to intervene. It was not until late in the afternoon that he succeeded in getting the men to resume their labour.

THE HISTORY OF SALFORD.

ON the 16th inst. the people of Salford celebrated the fiftieth anniversary of the incorporation of the borough. Opportunity was taken of the occasion by the *Manchester Guardian* to recall the history of Salford as follows:—The Roman encampment at the confluence of the Medlock and the Irwell, on the spot which used to be known as Castle Field, gives Manchester a precedence of some centuries, and carries back its history to a time when hundreds and wapentakes and feudal barons were unknown; and we are carried still farther back if, as is supposed, the site of the Roman encampment had previously been occupied by a British settlement. But, after all, this must be to a great extent a mere matter of names. If the eligibility of a spot attracts a population to one side of a narrow stream, we may be pretty sure that there will be people on the other side. In other words, at whatever date there may have been a Manchester we may reasonably conjecture that there was, on a smaller scale perhaps, a Salford too. This is shown to have been the case when we come down to times that are better

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in $4\frac{1}{2}$ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

known. Soon after the Conquest we find the beginnings of modern Manchester on the rather bold bluff which rises above the Irwell close to where it is joined by the Irk. It is where the cathedral and the Chetham College now stand. There was then a church dedicated to St. Mary, and close at hand the residence of the baron who owned the manor, while behind them clustered a little population already addicted to industrial arts. We find at the same time on the lower land across the river a community beginning to form itself, and apparently employed in work distinct from agriculture. These people had the broad lands of the hundred behind them, yet they chose to gather at this particular spot where the Irwell is thrown aside by the rocky cliff and shoots in a comparatively straight course westward. There was no chance in the selection. The communities on the two sides of the river attracted each other. They must have been useful to each other in many ways, and were then, as they have been ever since, substantially one community under two names. But there was one difference between them which had an important result. They were not under the same manorial lord. If they had been they would have received the privileges of a borough from the feudal superior at the same time and been formed into one borough, whereas through their belonging to different lords they were enfranchised at different dates and the municipal division was set up which exists to-day. That the people of Manchester and Salford still form two corporate bodies is due to an incident of feudalism.

A borough charter was conferred upon Salford by Randolph de Blundevill "in or about" 1231; Manchester received its "great charter" from Thomas de Grelley in 1301; so that Salford is the older borough by seventy years. Judged by their contents these charters do not greatly differ from what would now be described as a Police Act. They confer upon the inhabitants the right of managing their own affairs and lay down certain rules which have to be observed. The most important provision of the Salford charter runs thus:—"Also the aforesaid burgesses and their families, from whomsoever they buy and to whomsoever they sell, wherever it shall be in my demesnes, whether in fairs or markets, they shall be free from all toll except that of salt." The Salford charter is of great historical interest, much greater than that of Manchester. Randolph de Blundevill was one of the most remarkable men of his day. He was Earl of Chester and Earl of Lincoln, and held for a time the Earldom of Leicester. He married Constance of Brittany, widow of Geoffrey, second son of Henry II,

and was thus stepfather to Arthur, the young prince supposed to have been murdered by King John. By right of marriage he sometimes styled himself Duke of Brittany and Earl of Richmond, but it must be added that his wife deserted him and took to herself another husband. He was one of the barons who signed Magna Charta, but he did so on behalf of the king, to whose interests he adhered. In 1229 he received from Henry III. a confirmation of the lands between the Ribble and the Mersey which he had purchased from Roger de Mersay. These were the three wapentakes or hundreds of West Derby, Leyland and Salford, of which he then obtained full possession. For the next two years he was fighting in Normandy and Brittany, but he reached England in 1231, the year to which the Salford charter is assigned. Among local feats, he built Beeston Castle to keep the Welsh at bay, and conferred burgess rights upon the town of Macclesfield. Bishop Stubbs says that his vast possessions, and especially his palatine jurisdiction, "made his position in the kingdom unique," and adds that "he was almost the last relic of the great feudal aristocracy of the Conquest." The granting of the Salford charter, which he confirmed for himself and his heirs "to the end of the world," was almost his last act, for he died the year after. Among the thirteen persons who signed the charter as witnesses was one even more famous than himself, Simon de Montfort, the great Earl of Leicester, to whom we owe the Parliament of 1265, and who fell at the battle of Evesham. It may be safely said that few borough charters are richer in historical associations than that which lies open to inspection at Peel Park.

For several centuries after the date of the charter the accounts we have of Salford are brief and scanty, and even when we come to later times, though there is more information, our position is not much better, since it is not easy to say how much of it relates to Salford and how much to Manchester. Visitors took the same liberties with the two boroughs as is still taken in every part of the world. They came to Manchester, and they described Manchester without making any distinction between one side of the Irwell and the other. This is a misfortune, but since we cannot make people antiquaries against their will it cannot be helped. Perhaps the best bridge across the gulf of time is Salford Bridge, which always retained the name distinctive of the hundred. There is nothing to tell us when it was built, but it is referred to in the will of Thomas del Bothe, an "opulent yeoman" who lived at Barton in the year 1368. He built a chapel on the bridge, where prayers might be offered for the repose of his soul. During the

Commonwealth the chapel was turned into a prison, as was also the college, then belonging to the Earls of Derby. In 1778 the chapel-prison, then apparently in a ruinous condition, was cleared away in order to make room for the widening of the bridge. At last, in 1837, when the period of street improvements set in, the bridge was closed, and a new one built and named after Queen Victoria. The Manchester Court Leet Records abound with references to Salford Bridge. On one occasion the person occupying the premises near the bridge is required to see that the steps leading down to the water are kept clean. On another the owner of a dunghap near the bridge is ordered to abate the nuisance. The Old Church is a "bridge" of another kind. It serves to connect the two boroughs ecclesiastically. Salford was in the parish of Manchester, and the Old Church was for a long time the only place of worship for the people on both sides of the river. In the ninth year of the reign of Henry V. the church was turned into a collegiate church by Thomas de la Warre, at that time rector. The church had been dedicated to St. Mary from the beginning, but just before the change the battle of Agincourt had been fought and Henry V. recognised as heir to the French crown. Accordingly, on the new foundation the church was dedicated to St. Mary, to St. Denis (the patron saint of France), and to St. George (the patron saint of England). It would perhaps be difficult to say whether the virtue of this triple dedication still survives. At length it seems to have been felt that further provision was necessary for the spiritual wants of Salford. In 1634 Humphrey Booth the Elder laid the foundation of the Sacred Trinity Chapel, the name being perhaps intended to show the relation in which the founder wished it to stand to the old parish church. A subscription of 200*l.* was raised towards the cost; the rest was defrayed by Booth. The good man, then in feeble health, earnestly prayed that he might be permitted to partake of the sacrament in the new chapel. This granted, he would not care to live any longer. The sacrament could not be celebrated in the place till after its consecration, and this involved some considerable delay. But he had his heart's desire. He lived to partake of the sacrament, but he got home with difficulty, and never went out again.

Humphrey Booth was a munificent benefactor to his native town. He left by his will certain property in Piccadilly and Oxford Street, directing that the yearly rents and profits "should be for ever yearly, faithfully, and wholly disposed of for the

succour or relief of such poor, aged, needy, or impotent people as for the time being should inhabit or dwell within the town of Salford, and by the judgments and good discretions from time to time of the two constables of the said town for the time being, and of such churchwarden yearly, in the parish church of Manchester, as should from time to time be elected churchwarden for the town of Salford, or of any two of them, whereof such churchwarden should be one, should be deemed to have need thereof." The property thus put in trust was, as has been seen, situated in Manchester, and has risen in value with the prosperity of the town. Twenty pounds a year is mentioned as its value in Booth's lifetime. From the statistics given at the recent Easter meeting it appears that for the last twenty years the sum distributed among the poor amounts to a yearly average of nearly 7,000*l.* Humphrey Booth the Younger, grandson of the elder Humphrey, by his will of 1672 "devised certain premises therein named towards the repairs of the chapel of Salford," and in the case of an overplus he directed that it should be distributed among the poor at Christmas in the same way as the money left by his grandfather. Trinity Chapel was rebuilt in 1753, having then become ruinous. It is interesting as the mother church of Salford. The radiation from this centre went on slowly. St. Stephen's, the next in point of antiquity, was built in 1794—just one hundred years ago. St. Philip's followed in 1825, the cost being covered by a Parliamentary grant of 14,000*l.* Of more importance was the erection in 1831 of Christ Church, Acton Square, for the late Rev. Hugh Stowell, who had previously held a curacy in Salford, and who was for many years a potent force in the religious life of the community. The other churches are all of more recent date. Long before this the Nonconformists had begun to take up their share of spiritual work. Gravel Lane Chapel, the mother church of Salford Methodism, was opened in 1790. The oldest Independent chapel was built in 1819. Other denominations entered later, the places of worship in Manchester having probably been found sufficient for their needs. St. John's Roman Catholic Church, the cathedral church of the Salford diocese, was opened in 1855. The borough now contains a large number of handsome buildings devoted to religious uses, almost every denomination being represented—a striking contrast to the ecclesiastical aspect of the place in the days of Humphrey Booth, when a single edifice of moderate size was the only provision made, apart from the parish church, for the church-going wants of the entire population.

GASHOLDER CONSTRUCTION.*

GASHOLDER construction is far from being an exact science. It seems still to be in an experimental stage; there are no standard lines or data to be carefully adhered to as in the construction of roofs and bridges. These latter are built to suit the purpose for which they are required with sufficient strength and without waste of material. Can this be said of the large gasholders of the present day? Judging by the diversity of design displayed this must be answered in the negative.

In a search for economy in gasholder construction, the first and largest item that catches the attention is that of exterior support; its cost is generally from 30 to 50 per cent. of the total expenditure, without contributing a single foot to the storage capacity on the works.

Let us look for a moment at the nature of the support supplied to keep the floating vessel of a gasholder in a level position. When a gasholder was the simple thing as at the beginning of this century, it mattered little if the few short posts used were much more substantial than necessary; it is now a very different matter in the case of a modern gasholder, containing as many thousands as the former did hundreds of cubic feet. When a vessel of great size, rising to a height of 150 or 200 feet, has to be surrounded with twenty or thirty posts of a similar height, the question as to what constitutes a safe and economical support is a matter of great importance, and on this point there is great diversity of opinion.

Marked contrasts in design are frequently met with in holders of about the same size. The following are one or two examples:—

No. 1 Holder.

3 lifts, 150 feet by 30 feet, weight of columns	553 tons.
" " girders	159 "
Total	712 "

No. 2 Holder.

3 lifts, 150 feet by 30 feet 6 inches, weight of columns	198 tons.
" " girders	66 "
Total	264 "

No. 3 Holder.

3 lifts, 150 feet by 30 feet, weight of wrought-iron standards and girders	128 tons.
--	-----------

* A paper read by Mr. E. Lloyd-Pease, at the Society of Engineers.

This contrast forces upon the mind the observation that if the last-mentioned design is safe, the former designs are wasteful. From want of evidence to the contrary, it must be taken that the light lattice standards are strong enough.

From the fact that very light standards are seen to successfully do the work required of them round a large gasholder, the question arises whether the higher portions of them are of any value at all, or are ever called upon to bear an appreciable strain? And also, whether the inflated cylinder of iron that they enclose, held rigidly by the lower portions of the standards, and incapable of the slightest bending or vibration, is not infinitely stiffer than the higher portions of the standards, and in reality (from its own inherent strength) as immovable as a rock, when the lower portions of the standards are of sufficient strength?

There are other details, however, that have some importance. Many large holders that have worked with great regularity for a long period have crown carriages of the very simplest design and, in comparison to some modern carriages, of the very lightest description. There is a fashion in these things, and at the risk of hazarding a suggestion that may be questioned, it would almost appear that the use of tangential and radial rollers in carriages on the upper lifts has spread from their use in the large holders of the South Metropolitan Gas Company. If they are necessary, or their use justified on such exceptionally large holders, which in themselves struck out into a new line, can they be considered to be necessary in holders not half the size, when past experience has abundantly shown that very simple and almost fragile carriages are sufficient? If they are not necessary, their use is a mistake, seeing that they are, in proportion to their weight, by far the most costly part of a gasholder.

The use of tangential rollers on the outer lift, when one or more lifts rise above the columns, is quite another matter, since the question of leverage of the wind presents itself.

These two points, the massiveness of the exterior supports and the construction of the carriages that bear upon them, with the number and strength of the vertical stays in the holder body (and perhaps there ought to be added the weight of the top curb), are all points in which there is great divergence in practice. There is no finality in the existing information on these points.

It is just possible that some surprising facts would come to light, if a careful investigation were carried out as to what is proved to be actually sufficient in various existing holders in the four points just referred to. The collection of designs thus

WALL INLET VENTILATOR WITH INDICATORS (DARRAH'S PATENT).

Incorrect Indication Impossible. Only One Action.

In the above we have introduced a most important improvement. It consists of an Enamelled Indicator, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

NATIONAL TELEPHONE No. 6.

Telegrams:—"IRON, WELLINGBORO."

formed, if selected in parts and placed together to form one holder, might lead to a standard design—light, simple and cheap. This paper, however, attempts to approach the question of how far the construction of a holder can be cheapened and simplified from other considerations.

The Use of Columns.

It goes almost without saying that the usual custom of providing columns to the full height of the holder is founded on the belief that the holder when fully inflated is not in itself sufficiently strong to resist the force of the wind. Possibly this has to some extent been led up to by the fact that holders have invariably been contained in excavated tanks and counterbalanced, in which case columns have to be provided to support the counterbalance. If it had not been so, and iron tanks on the surface had been used, it would very early have been found that the supporting arrangement of three ropes connected to one weight, even if the ropes were attached to the bottom curb, supplied all the support required, and that the holder itself was abundantly strong and stiff without assistance from any columns.

If, then, the problem of gasholder building had developed from the premises that small holders were sufficiently strong, instead of from premises that columns, whilst carrying the balance-weights, were also necessary for the support of the holder, there would not now be the very strong prejudice in favour of columns the full height of the holder that is so widely spread.

Seeing that the largest gasholder ever constructed has two lifts without external guide framing, and many smaller holders have been built without columns of any description, the fact that guide framing is, to some extent, superfluous has been demonstrated without doubt. But this fact is not generally acknowledged and acted up to so as to have become trite and uninteresting.

In the opinion commonly prevailing, the function of columns divides itself into two—that of preventing distortion and of preventing overturning. If they are not needed for the former case, they need only be built to meet the second demand upon them—that is to say, if a gasholder will keep its form, columns are only required to such a height as would prevent overturning. There are three factors that lend weight to the theory that the gasholder requires little, if any, exterior support.

In the first place, the weight of the sides suspended from the top curb places the side sheeting in tension, and this is at

its maximum at the top and runs out to nothing at the bottom curb. At the bottom of the second lift, in a three-lift gasholder for example, it exists to the extent induced by the weight of the outer lift.

In the second place, gasholders are by no means structurally devoid of power to resist the pressure of the wind, for it must be remembered that they are more than able, as far as each of their lifts is concerned, to bear their own weight without distortion, as is shown by the fact of their standing on the tank resting-stones before inflation. This structural strength may certainly be estimated as being in reserve, for when inflated and suspended in a normal condition, their powers in this direction are quite untaxed.

In the third place, inflation itself creates considerable additional stability in the holder.

In considering the question of the ability of the "free" lifts or lift of a telescopic holder to withstand wind-pressure without distortion, the strength imparted by all three factors before mentioned has to be estimated.

In a case in which exterior support is discarded altogether, the tension in the sides induced by the hanging weight ceases to be a valuable factor, seeing that it practically does not exist where the light sheeting begins just above the bottom curb, and which is presumably where buckling would first of all show itself, because (if the expression may be allowed) it is not in this position pulling at anything, and therefore not taut. In the following remarks an attempt is made to estimate the ability of a three-lift gasholder, 180 feet diameter by 30 feet deep, to resist the pressure of the wind when—

1. Supplied with outside support to the height of one lift.
2. Without any exterior support.

The wind-pressure of a 40 lbs. per square foot gale against the windward surface of the two upper lifts may be taken to be—

$$\frac{180 \times 60 \times 40}{2} = \text{say, } 97 \text{ tons.}$$

The question of parallelism of the holder need not come into question here; it is presumably secured by the weight and strength of that portion of the holder within the columns working of necessity with a horizontal movement. Whether other means besides the use of ordinary rollers and carriages can be with advantage adopted will be referred to later in this paper.

The outer lift of a 180-feet holder may be taken to weigh about 90 tons. This is supported by the inner and second lifts. The lower part of the second lift, that just rising above

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above are labelled, either inside or outside with our Trade Mark—"The Anchor."

the columns, is in vertical tension to the extent of 90 tons, *i.e.* to the amount of the weight of the outer lift hanging upon it. The outer lift is essentially horizontal. Owing to its position within the columns, and its weight being distributed round the entire circle of the inner lift, there is obviously a strong tendency for the sides to maintain a vertical position, and for the crown of the holder to be horizontal and parallel with the outer lift.

The model c has been constructed to represent this point. The model represents a three-lift holder, 180 feet by 30 feet each lift. The two inner lifts are constructed of silk only, without any vertical stiffeners; the outer lift is made of tin of such a weight as to give approximately the same water-pressure as the outer lift of such a holder, *viz.* 2½ inches. Any stiffness displayed by the two inner lifts is entirely due to the fact that they form the connecting link between the horizontal hanging weight of the outer lift and the vertical support of the gas. The holder can only be bent or distorted about the bottom part of its second lift by a force sufficient to overcome the vertical tendency of the gas and bend it about the same point, the lower third of the gas being unaffected. There is an elasticity and springiness in a column of gas confined under these conditions, when the lower portion is confined in a heavy and horizontal vessel, sufficient to transform by inflation the most flimsy material into a substantial structure.

It may be argued, therefore, that there is considerable stability given to the "free" lifts of a holder by the column of gas they contain. Being vertical in itself, and held, as it were, as to a third of its height in a vertical position, it supports the vessel by which it is confined.

It is now necessary to consider the strength that the shell of a holder may possess as an iron structure in forming an estimate of the ability of the lifts rising above the guide framing to resist the force of the wind.

It has been mentioned that the sides of a holder whilst at rest, and standing on the resting-stones in the tank, exhibits no signs of distortion in that portion of the sides that joins on to the strong plates of the cup, and that supports approximately the whole of the crushing weight of the sides. It is evident from this that the sides of the holder have at least this amount of structural strength, a strength that is not drawn upon when the holder is inflated and hanging suspended, in contradistinction to standing on the resting-stones.

The second lift of the holder, taken as an example, weighs about 80 tons. As the ability to withstand a crushing force

equal to this weight still exists when the holder is inflated, it must be taken into consideration when estimating the ability of the holder to offer resistance to the distorting power of the wind. Although this second lift is a structure capable of sustaining a weight of 80 tons, the actual conditions under which it exists in normal circumstances are such that in place of being subjected to compression it is really in tension to about the same amount, owing to its own suspension and the weight of the outer holder (90 tons) hanging upon it.

The lowest portion of the light sheeting of the second lift, consisting of ⅜-inch sheets, may be considered to be the first point at which buckling or crumpling would make its appearance; this, however, cannot take place until the vertical tension of 90 tons and the latent strength of the sides of 80 tons has been overcome—together equal to 170 tons. The wind-pressure of a 40 lbs. per square foot gale on the inner and second lifts is taken to be 48 tons and 49 tons respectively. That of the inner lift is taken to be applied at the dip of the second lift owing to the holder being a jointed structure. The two forces combined produce at the distance shown of 91 feet 6 inches an induced strain of 24 tons, acting downwards as shown by the right-hand arrow. Against this 24 tons is to be placed one-half of the 170 tons of the combined resistances, *i.e.* 85 tons against 24.

The conclusion pointed to by these figures is that whilst buckling tendency on the lee side of the holder may be taken at 24 tons, the force tending to keep them straight and vertical owing to the tension induced by the outer lift is as much as 45 tons—that is, half the weight of the suspended outer lift.

Thus the first of the two factors is in itself more than sufficient to resist the power of the wind, the structural strength of the holder remaining in reserve.

Besides these two there is a third factor, *viz.* the strength imparted to the whole structure by the rigidity of the sheeting when inflated.

The sides of a gasholder are, as is well known, constructed with strong vertical stays, frequently of channel iron, connecting the plates at the top and at the bottom of each lift used in the construction of cups and dips or top and bottom curbs. The sheeting which is placed on the outside is frequently not attached to the stays. In an uninflated condition the sheeting adds little to the strength of the shell, but the reverse appears to be the case when gas at considerable pressure is confined within. For the lee side of a gasholder to assume a convex form (in elevation) the formation of corrugations in the side

sheeting is essential—that is to say, the iron necessary for the bulging or leaning over of the lee side can only be obtained by a flattening of the sides of the holder.

If the top part of the second lift be considered to be forced over to the right by the great power of the wind, the sheeting would be found to be drawn into corrugations as suggested in the sketch. The vertical stays on the lee side are greatly supported by the sheeting. The stays are attached at the top to the strong plates of the dip, to which the sheeting is also attached. In order to depart from the vertical, the stays through the heavy plating must drag upon a large area of sheeting. The sheeting on both sides of the holder, in order to admit of this movement, must, leaving its semicircular form, become flattened, and assume that of chords of arcs. This is prevented by the verticals, and also by the support given by the gas. Whilst the former provides that no vertical contraction in the sides takes place, or any flattening in their immediate neighbourhood, it is the gas pressure within that renders the whole rigid, and so struts out the sides that they form a very efficient backstay to the leeside verticals. The centre post and back legs of a derrick crane seem to be to some extent a parallel. The strength of the inflated side sheeting, together with the two factors dealt with previously, appear to make up a very effective trio, interacting one with the other.

Holdings without Exterior Framing.

No tension exists in the lower portion of the side of the outer lift of a holder, so that this cannot be relied upon, as in the case when the second lift was being considered.

In the case of the outer lift, the ability to withstand the wind strain depends on the structural strength of the lift, and the rigidity imparted to it by the inflated sheeting.

It will be seen that the wind-pressure is taken to be 97 tons at 30 feet from the ground, and 50 tons at 15 feet, and the induced compression at X as 40 tons. In a gasholder of ordinary construction of this size, there would be about 40 vertical stays of 6 by 3 by $\frac{1}{2}$ -inch channel iron; each may be estimated to be capable of resisting a vertical compression of 19 tons. Taking the twenty verticals on the lee side as effective at X, there is a total effective resistance 380 tons.

As suggested in the foregoing remarks, the side sheeting ties back the verticals, and prevents them bending about the bottom curb to which they are fixed, and in this position they have the very great vertical resistance mentioned above. The factor of safety of nine to one, shown by these figures

(40—380 tons), leaves a margin for reduction on the score of too high an estimate of the efficiency of the channel iron verticals. There is absolute proof that the outer lift, being able to sustain its own weight of 90 tons, is at least able to sustain a crushing force of 45 tons on the lee side, which in itself is 5 tons more than the estimated induced compression of the wind. There is, therefore, a sufficiency of strength by relying only on that absolutely shown to exist, and without the support of any estimate, however sound. Unless these arguments are altogether fallacious, there is a large margin of strength in an ordinarily constructed 180 feet diameter holder to withstand a gale of wind, without calling upon outside assistance to prevent distortion.

The Employment of Steel Ropes.

There is no doubt whatever but that a well-designed gas-holder needs no exterior aids to enable it to withstand the force of the wind, except that which is necessary to keep it in its working position. The vertical rise and fall has been usually secured by the use of columns. This is a very expensive method, the cost of these in lofty holders being a large percentage of the total cost. By doing without columns or wrought-iron standards, and arranging that the wind strain on the upper portion of the holder shall be transmitted through the holder itself to the ground line, a great saving in cost must obviously be effected.

How this is secured by means of steel ropes will now be briefly described. It must be noticed that three is the smallest number of ropes that suffices to produce parallel movement in a holder. One rope, as shown, checks irregular movement in one direction only. It will be seen that the rope is fixed to a bracket A on the tank, passes over pulleys B and C on the crown, under D on the bottom of the holder, and up to E on the tank where it is fixed; the rope is not fixed to the holder, the holder is perfectly free to move within the rope. If the holder be regarded as gradually sinking it will be clear that since D C and C B are fixed distances, D E and A B are the only variable distances, and that it is impossible for D E to increase to a greater amount than A B diminishes.

The result of a gale of wind, as suggested by the arrow, is a tendency for both E D and A B to increase at the same time; as this is an impossibility the holder will remain upright as long as the rope holds.

If the circumference of the holder be divided into three equal portions by three ropes trained as this one, it is impos-

sible for the holder under any circumstances to rise or fall irregularly.

Model D shows a section of a holder, exhibiting the working of two ropes. This simple arrangement, viz. that of rope control, has been used with the greatest success in numerous instances, the number of ropes used varying according to the size of the holder. In many cases it has been used when it has been desired to add to the number of lifts in a holder without increasing the height of the columns or standards. A great saving in cost is the result from the adoption of this plan.

It may here be stated that there are very many ways of applying the rope system, the details of which are unimportant at the moment. The rope shown is fixed to a bracket at A, passes over B and C, under D on the inner lift, over E on the dip of the outer lift, under F on the bottom curb, and up to G, where it is fixed.

Whilst the holder descends, and until the outer lift lodges in the tank, the only two variable distances are F G and A B, and since the former can increase only to the extent that the latter, A B, diminishes, the holder cannot tilt over in the direction of G. As soon as the inner lift sinks within the outer, D E and A B are the varying distances, and there is the same inability as before on the part of D E to increase to a greater extent than rope is set at liberty by the approach together of A B. As in the former case, three ropes will theoretically suffice to keep the holder vertical, though in practice more are employed in proportion to the size of the holder and the amount of wind-pressure to be resisted.

Model C shows four ropes on a two-lift holder. The function of the ropes is to equalise the balance between the two sides of the holder, the lee and windward sides. The balance on being disturbed by the wind is at once readjusted by the rope on the lee side; it carries some of the overplus of weight, and transfers it to the windward, where weight is required to counterbalance the upheaving of the wind. As an interesting point only, and not because it has any value in actual practice, it is proposed to shortly examine the supporting power of a single rope. In the first place, the training of the rope enables it to do duty up to double its strength.

The training of the rope is precisely the same as that already shown, with the modification that the ends are attached to weights in place of brackets. A point is indicated in the interior of the holder as that about which movement would take place. On the left side is a downward force of 36 tons—this is exactly balanced by the two hanging weights of 18 tons

each; therefore, although the work done in supporting the holder is 36 tons, the strain on the rope is but 18 tons.

Applying this to an actual holder it will be found that the 180 feet by 90 feet holder that has been taken as an example requires, under the pressure of a 40 lbs. per square foot gale, support to the amount of 36 tons. It would require therefore a holder of this great size to strain nearly to breaking point one ordinary $\frac{3}{4}$ -inch steel rope. This is merely given as an illustration of the power available in steel ropes in supplying the necessary support to large holders. In actual practice such a holder would be supported by, say, eighteen $\frac{3}{4}$ -inch ropes. Contraction and expansion of the rope is arranged for by the use of compression springs placed on the holding brackets to which the ends of the rope are attached.

These details in connection with the rope system may appear somewhat out of place in a paper that commenced with a criticism of the cost of modern holders, but perhaps they can claim admittance on the ground that the support of the holder is a very large item in the cost, and that the economy of using new means or the wastefulness of the old cannot be estimated until the new method has substantiated its claims.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

At the ordinary meeting of this Society a paper was read by Mr. R. Nelson Boyd, M.I.C.E., &c., on "Liquid Fuel in the Future." The author began by referring to the use of hydrocarbons or liquid fuel in the past, which were first introduced after the early development of petroleum in America in 1859. Several patents were taken out in this country for the application of liquid fuel as far back as 1863. The most successful general application of liquid fuel was made by Mr. Urquhart in South Russia. Mr. Holden has recently adopted liquid fuel on the Great Eastern Railway. The calorific value of petroleum was discussed, and divers authors and results cited, from which it appears that practically one ton of petroleum residue is equal to nearly two tons of coal. The advantages in the use of petroleum were then referred to, and amongst these were economy of stoking on board ship and ease of working on locomotives. The results obtained on the Great Eastern Railway, and the account of a steamer using petroleum residue only on a long journey across the Pacific Ocean, were given in some detail. Reference was made to the present and future use of hydrocarbons as liquid fuel; the oil-engine was cited, and its applications to

mining and other purposes. The advantages were pointed out which the oil-engine possesses over steam-engines in the economy of space and first cost, and over gas-engines in its applicability in situations remote from gas-works. Some reference was also made to the increasing use of petroleum for domestic purposes, that is, in cooking-stoves in place of coal or gas in small households. The paper ended by a reference to the supply and cost of liquid fuel, pointing out that at present the supply to this country was entirely derived from two foreign countries, namely, the United States of America and Russia. Under these circumstances the author was of opinion that it would not be wise to adopt petroleum as a fuel for the Royal Navy, and that although the supply of illuminating oil was adequate and the prices reasonable, the quantity available when considered as fuel was very small as compared with the consumption of coal. The conclusions of the author were that, although the problem of the applicability of liquid fuel had been solved, there remained the serious considerations of a large and constant supply at a sufficiently low cost to compete with coal.

ST. PAUL'S, PENZANCE.

THE enlargement of St. Paul's Church, Penzance, has been completed, and the church reopened. The original church, which was built from the plans of Dr. Hocking in 1843 for the Rev. Henry Batten, the founder, was of Early English architecture, or that style which prevailed between the period from 1230 to 1260. It was in the form of a cross, 60 feet in length, 22 feet in width, and about 56 feet in height from the floor to the apex of the roof. Alterations and additions have from time to time been made in the fabric and fittings, and several attempts made to enlarge it. The present enlargement consists of a reproduction of the 1843 church; the north wall and north transept have been taken down, and the roof of the old church taken up and supported by massive granite columns, with a bold but exceedingly elegant moulded cap with arch stone, and the effect on entering the building is impressive. New three-light windows have been placed in each of the eastern and western gable ends. The new serpentine font given by the Coulson family has been placed near the north porch door. The chancel has been enlarged, additional accommodation made for the choir, and the lectern removed from the front of the chancel steps to near, and in front of, the pulpit. The new stall for the vicar has been presented by the choirmaster,

Mr. Stephen White. Additional sitting accommodation for 160 persons is provided for in the enlargement; special attention has been given to the provision of proper accommodation for the Sunday scholars, and in the north gable end an entrance has been provided for them from the school buildings. The house and premises at the north of the building have been acquired by the officers and will be fitted up as clergy and choir vestries. The cost of the enlargement has been about 1,600*l.*, and the work has been carried out by Mr. W. H. Stephens, of Penzance, from the plans of Mr. J. W. Trounson, F.R.I.B.A., of Penzance.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 6563. George Henry Couch, for "Improvements in ordinary window-frames, with sliding sashes and fittings thereof."
- 6580. Leonard Poilvache, for "Improvements in automatic door-closing apparatus."
- 6505. Rowland Pennington, for "Improvements in or connected with windows."
- 6664. George Henry Couch, for "Improvements in window-frames and sashes and fittings thereof."
- 6746. Henry Harris Lake, for "An improved safety-hasp."
- 6764. William Nicol, for "Improvements in and relating to windows and the like."
- 6775. Herbert F. Harcourt, for "Window-sash fastener."
- 6846. Francis Richard Lowson, for "Improvements in and relating to architects' set squares."
- 6854. Samuel Easthope, for "Improvements in the construction of split loose-pulleys."
- 6870. James Pride, for "Improvements in the construction of split loose-pulleys."

THE Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

BIRMINGHAM.—May 28.—The Guardians of the King's Norton Union are desirous of receiving Competitive Plans for the Erection of a plain and substantial Infirmary upon Land adjacent to the Union Workhouse, Selly Oak. Mr. Edwin Docker, Clerk, Birmingham.

COCKINGTON.—May 1.—Plans are invited for New Church. Rev. T. S. Rundle, Cockington, Torquay.

LANCASTER.—May 1.—Competitive Drawings invited for Extension of Markets, and Erection of a New Hotel. Mr. John Cook, A.M.I.C.E., Town Hall, Lancaster.

LLANDUDNO.—May 31.—Designs are invited for Municipal Buildings. Mr. E. P. Stephenson, A.M.I.C.E., Llandudno.

LONDONDERRY.—May 1.—Plans are invited for proposed Baths and Washhouses. Mr. Robert N. Chambers, Guildhall, Londonderry.

CONTRACTS OPEN.

ABERDEEN.—May 1.—For Additions to University Buildings, King's College. Messrs. Matthews & Mackenzie, Architects, 255 Union Street, Aberdeen.

ALSAGER.—May 2.—For Building Church. Mr. W. Wright, Surveyor, Lancaster.

BOLLINGTON.—April 30.—For Putting-down Borehole. Mr. W. H. Radford, Engineer, Angel Row, Nottingham.

BRISTOL.—April 30.—For Building Board School. Mr. F. Bligh Bond, Architect, Liverpool Chambers, Corn Street, Bristol.

BURGHCLERE.—May 1.—For Rebuilding Chapel. Mr. J. T. Stead, 30 Bartholomew Street, Newbury.

CAERPHILLY.—May 2.—For Building Chapel. Mr. J. H. Phillips, Architect, St. John's Chambers, Cardiff.

CALDICOT.—April 28.—For Additions to Schools. Mr. F. R. Bates, Architect, 4 Commercial Street, Newport, Mon.

CARLTON.—May 9.—For Building Board School for Infants. Messrs. Senior & Clegg, Architects, 15 Regent Street, Barnsley.

CHELTENHAM.—May 2.—For External Fire-Escape Stairs at the Workhouse, and other Works. Mr. J. T. Darby, Architect, Tavistock Place, Cheltenham.

CHESHUNT.—May 5.—For Drainage and Water-Supply Works to Six Villas. Mr. James Bunce, Turner's Hill, Cheshunt, N.

CLAY CROSS.—May 8.—For Building Board Schools. Messrs. Rollinson & Son, Architects, 13 Corporation Street, Chesterfield.

CLAYTON.—May 5.—For Building Eight Scullery Houses. Mr. Sam Spencer, Architect, 344 Great Horton Road, Great Horton.

COCKERMOUTH.—May 1.—For Erection of Purifier House and other Buildings at the Gasworks. Mr. E. W. Smith, Gas Manager.

CORK.—May 2.—For Building Chapel and House of Retreat. Mr. S. F. Hynes, Architect, 41 South Mall, Cork.

THE "MONOPOL" Fire Extinguisher

FOR MANSIONS, PRIVATE HOUSES, HOTELS, HYDROS, RESTAURANTS, CLUBS, PUBLIC INSTITUTIONS, &c.

MADE IN VARIOUS SIZES.

Light and Portable. The smallest size, which contains Five Gallons, is particularly suitable for extinguishing small outbreaks of Fire. Larger sizes, containing Eight, Ten, and Twelve Gallons, are particularly adapted for Public Institutions, &c. The general appearance of the "MONOPOL" is artistic and strongly built and not likely to get out of order. Architects are invited to specify the "MONOPOL" for the above purposes.

PRICES AND PARTICULARS ON APPLICATION TO

MACINTOSH & CO., Wool Exchange, Coleman St., E.C.

DARLINGTON.—May 9.—For Stations and Buildings for Railway Extension. Mr. Ernest E. Meek, Secretary, Darlington.

DUBLIN.—May 7.—For Additions to Institution for Imbeciles, Palmerstown. Mr. G. P. Beater, Architect, 17 Lower Sackville Street, Dublin.

DOWLAIS.—May 5.—For Building Church, Pengarnddu, and at Pontclown. Mr. E. M. B. Vaughan, Architect, Cardiff.

ECCLES.—April 30.—For Construction of Boiler House, Engine and Pump House, Chimney and other Buildings at Sewage Farm. Mr. H. L. Hinnell, Engineer, 15 Mawdsley Street, Bolton.

FARNHAM.—For Additions to Grammar School. Mr. Paxton Watson, Architect, Farnham.

GILFACH-FARGOED.—April 30.—For Building Sixteen to Twenty Cottages. Mr. T. Roderick, Architect, Ashbrook House, Clifton Street, Aberdare.

GODALMING.—May 7.—For Building Technical and Art School. Mr. Samuel Welman, Borough Surveyor.

GREAT YARMOUTH.—April 30.—For Works at Board School. Messrs. Bottle & Olley, Architects, Regent Street, Great Yarmouth.

GUILDFORD.—April 28.—For Constructing Pavilion on Sports Ground. Mr. A. J. Sturges, Architect, High Street Chambers, Guildford.

HASTINGS.—May 1.—For Additions to Board Schools, Mount Pleasant. Messrs. Elworthy & Son, Architects, London Road, St. Leonards-on-Sea.

HUNSTANTON.—May 10.—For Building Detached Residence. Messrs. George Fill & Co., Architects, 1 Queen Street, Norwich.

LAKENHAM.—May 5.—For Building Four Dwelling-houses. Messrs. George Fill & Co., Architects, 1 Queen Street, Norwich.

LEEDS.—April 28.—For Building Two Houses. Messrs. Swale & Mitchell, Architects, 98 Albion Street, Leeds.

LEICESTER.—May 1.—For Pavilion for Bowling Green. Mr. E. G. Mawbey, Borough Surveyor.

LLANELLY.—April 30.—For Building Board School for Infants. Mr. J. B. Morgan, Architect, Llanelly.

MARYPORT.—April 27.—For Building Five Houses. Mr. C. Eaglesfield, Architect, Maryport.

MORLEY.—May 2.—For Building Mill Premises and Chimney. Mr. G. B. Clegg, Architect, Morley.

NEWBURY.—May 7.—For Construction of Cattle Shed. Mr. E. A. Strickland, Borough Surveyor.

NEWCASTLE.—April 27.—For Police Station. Messrs. Marshall & Dick, 4 Northumberland Street, Newcastle-on-Tyne.

NEWCASTLE.—May 3.—For Constructing Bridge, &c. The County Surveyor, Moot Hall, Newcastle-on-Tyne.

NOTTINGHAM.—April 30.—For Building Police Station, &c. Mr. Arthur Brown, Borough Engineer.

OULTON BROAD.—May 5.—For Building Temperance Hotel and Boarding House. Messrs. George Fitt & Co., Architects, 1 Queen Street, Norwich.

OXFORD.—April 28.—For Alterations to 3 Avenue, Meat Market. Mr. J. J. Bickerton, Town Clerk.

PONTYCWMMER.—May 2.—For Additions to Board Schools. Mr. Philip J. Thomas, Architect, Bridgend.

READING.—May 1.—For Widening and Reconstructing Two Bridges, also New Bridge and Subway near Railway Station. Mr. G. K. Mills, Secretary, Paddington Station, W.

SELBY.—May 1.—For Building Thirty-three Cottages. Messrs. Todd & Thorp, Land of Green Ginger, Hull.

SHEFFIELD.—April 28.—For Building Board School. Mr. C. J. Innocent, Architect, 17 George Street, Sheffield.

SHEFFIELD.—May 2.—For Construction of Public Baths. Mr. C. F. Wike, City Surveyor, Bower Spring, Sheffield.

SHEFFIELD.—May 4.—For Building Board School, Bole Hill. Mr. W. J. Hale, Architect, 13 St. James Row, Sheffield.

SHIBDEN.—May 1.—For Building Manager's House, &c., at Sewage Disposal Works. Mr. John Drake, Winterbank, Queensbury.

STANNINGLEY.—May 7.—For Building House and Premises. Mr. H. Hodgson, Architect, 27 Kirkgate, Bradford.

SWANSEA.—May 22.—For Building Board School. Mr. G. E. T. Laurence, Architect, 181 Queen Victoria Street, E.C.

SWINTON.—April 30.—For Additions to Board Schools. Mr. H. L. Tacon, Architect, 11 Westgate, Rotherham.

THURSO.—April 30.—For Building Hospital. Mr. James Brims, County Clerk, Thurso.

The largest and best variety of Fanlights and Sash Openers, &c., to suit all requirements. viz. details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture. Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

[Dated December 2, 1887.]

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208. Special thrust-motion rod-a section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

WATERLOO.—May 14.—For Additions to Town Hall. Mr. F. Spencer Yates, Surveyor to the Local Board, Town Hall, Waterloo.

WHICKHAM.—May 2.—For Building Board School and Teacher's House. Mr. T. C. Nicholson, Architect, Blaydon-on-Tyne.

WILLINGTON.—May 1.—For Rebuilding Pit Laddie Hotel. Mr. Cook, 59 Sadler Street, Durham.

YORK.—April 28.—For Building Two Semi-detached Villas, Upper Poppleton. Mr. Wm. Hepper, Architect, 4 Spurriergate, York.

IMPORTANT SALE OF LAND.

WE understand that Messrs. Debenham, Tewson, Farmer & Bridgewater will sell, at the Mart, on Tuesday, May 22, at 2 o'clock, the 55 acres of freehold building estate situate at Black Rock, in the parish of Rottingdean, just beyond Brighton borough boundary. The property possesses a frontage of about 3,135 feet to the main road leading from Brighton to Rottingdean, and is also intersected by the old turnpike road to Rottingdean, to which it possesses about the same frontage. The Brighton main sewer and the Corporation's water mains are laid throughout the length of the latter road. The land is especially adapted for the erection of moderate-sized detached and semi-detached residences, with gardens sufficiently large to allow of lawn-tennis, a class of house which it is almost impossible to find in Brighton, and much needed. The local rates are exceptionally low, being about one-third of the Brighton borough rates. The beautiful Downs in the rear of the estate afford delightful walks and rides, and there are golf links within a few minutes' walk. Great improvements have recently been effected at this end of Brighton, amongst others the extension of the well-known Madeira drive, which is within five minutes' walk of the property. The electric railway runs along the Undercliff to the same point, and is being extended past the estate to Rottingdean. There is a good omnibus service to all parts of Brighton.

At Ayr Mr. Hammond, electrical engineer, London, has just made a survey of the burgh with a view to the introduction of the electric light, and will submit a report to the Town Council.

TRADE NOTES.

AT the fourth annual meeting of the Ulster District Council for the National Registration of Plumbers, held at the Belfast Town Hall, the Lord Mayor of Belfast presided, and in moving the adoption of the report said that it was satisfactory to note that the plumbing-work in Belfast had very much improved during the last three or four years, and he thought this was most creditable to the master plumbers and their workmen.

THE Aldershot Waterworks Company, which has for many years past obtained its supply by the coupled tube well system, is now about to erect a new pumping-station to supply the increased demands of the district, and Messrs. Le Grand & Sutcliffe, hydraulic engineers, London, have just completed a 10-inch artesian tube well 320 feet deep. This forms the second of a new series of coupled tube wells, and these two yield a supply of 300,000 gallons per day of ten hours, which will be ample to meet increased requirements.

THE contract for the new Public Hall, Warrington, was let this week to Mr. R. W. Collins, builder, Warrington. The cost will be about 5,000£, and is being defrayed by the gift of that sum by Mr. J. Charlton Parr to the Corporation. The site is near the present Gymnasium, Palmyra Square, and operations are expected to be begun forthwith. Mr. William Owen is the architect.

WE have received a large illustrated price sheet from the Edison & Swan United Electric Light Co., Limited, of 100 Victoria Street, S.W., showing beautifully-designed electroliers, standards, brackets, pendants, hanging lamps, portable lamps, ceiling fixtures, &c. The ornamental character of design is well maintained throughout, and there is something suitable for every requirement or purpose.

BUILDING AND BUILDERS.

THE foundation-stone of the cemetery chapel at Hale, Altrincham, where the Altrincham Local Board are expending nearly 10,000 $\frac{1}{2}$., has been laid by Mr. Alderman Griffin, chairman of the cemetery committee. The chapel is being erected from the designs of Mr. W. Owen, A.R.I.B.A., of Manchester, Mr. John Matthews, of Nantwich, being the principal contractor. The new building, which will be entirely faced with stone, is in the Decorated Gothic style of architecture, and will comprise chancel, nave, large mortuary, vestries, &c.

THE inaugural dinner of the Wolverhampton Master Builders' Association took place on Thursday evening at the Star and Garter Hotel, when a numerous company sat down. Mr. Henry Gough occupied the chair, and amongst those present were Councillor Shepherd, Messrs. J. Bradney, T. Jones, T. Perry, B. Guest, G. Cave, W. Myring Skett, J. Jones, Herbert, Swift, Hallchurch, Carding, Hallett, R. Simpkins, and Gough, secretary. An excellent repast having been served, the loyal toasts were honoured in the customary manner. During the evening songs were rendered by Messrs. J. Orme and F. F. Sharpe. Mr. W. J. Bennett acted as accompanist.

At the meeting of the Warwickshire County Council a recommendation of the buildings committee was adopted, "That the plans for the new Petty Sessional Court-house at Nuneaton, police-superintendent's house, constable's house, cells, stabling, and accommodation for the Warwickshire School of Mining, prepared by the county surveyor, be approved, and that the surveyor be instructed to obtain tenders for the works from such builders as Alderman Haddon and Councillors Darlington and Satchell shall direct, to be submitted to the next meeting of the committee," an amendment, that the surveyor be instructed to advertise for tenders for the work, and submit them to the next meeting of the committee, being defeated.

At the meeting of the Partick Dean of Guild Court the following linings were passed:—The Scotstoun Estate Building Company, for the erection of seventeen cottages in Park Drive West, Park Drive South, and a new street fronting the North British Railway; estimated cost about 6,000 $\frac{1}{2}$. James M'Meekin, accountant; James Rankine, wright; W. & G. Kirkwood, plumbers; William Thompson, plasterer; James Foley, slater; and A. & J. M'Ewan, builders, for the erection of twenty self-contained houses in a street to be formed off Crow Road; estimated cost, 10,000 $\frac{1}{2}$.

VARIETIES.

MESSRS. P. & J. BAKER, oriental carpet importers, have removed to 3 Warwick Square, Newgate Street, where they have a splendid assortment of modern and antique carpets, some of the latter being as much as 300 years old.

MESSRS. ROMEIKE & CURTICE say the "Graydon gigantic wheel and recreation towers" that are now in course of construction at Earl's Court are the invention of Lieut. Graydon, and are making great progress under the supervision of the constructor, Mr. Walter Bassett Bassett, of Maudslay, Sons & Field. The foundations are in numerous parts delivered and work going up rapidly as seen from passing trains on the District and Metropolitan Railways.

At the meeting of the Royal Scottish Society of Arts, Mr. R. G. Hislop read a paper on an automatic safety hoist door, the advantage claimed for which was the automatic opening and closing of the intermediate doors by the action of the cage itself.

At the meeting of the Warwickshire County Council, Mr. W. Johnson called attention to the contracts for stone used by the roads and bridges committee, pointing out that whereas the payments for stone to owners in Warwickshire only amounted to 739 $\frac{1}{2}$., the amount paid outside the county was 1,561 $\frac{1}{2}$. He thought they ought, as far as possible, to do what they could for the employers and workmen in Warwickshire by purchasing stone within the county. Mr. C. Vero said that he was quite sure the desire of the committee and the surveyor was to study the interests of the county, and every facility would be given to test Warwickshire stone. If they found that it was suitable and durable, it would be purchased in preference to stone from other counties.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON) — "You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

AMONG the Polytechnic educational holiday tours a students' trip to Paris has been arranged for Whitsuntide, and will be of special advantage to art and architectural students. The party will leave Holborn Viaduct on Friday, May 11, at 8.15 P.M., and travel first saloon on boat and second class rail, *via* Dover and Calais. Three full days will be spent in Paris, and the party will arrive in London at 6 A.M. on Tuesday, the 15th. The fee, including hotel expenses, to bona-fide students of the Polytechnic, will be 2*l.* 10*s.*, and to others 2*l.* 15*s.* When one realises that the ordinary return ticket alone is 3*l.* 8*s.* 6*d.*, some idea is obtained of the special concessions that have been granted.

A SPECIAL fortnight's holiday tour to Lucerne has been arranged for building students and members of any of the art classes. The party will leave London on July 20, and will travel *via* Dover and Ostend, Brussels, and thence to Lucerne. Here the party will remain for one week, visiting all the points of interest in the district. The return journey will be *via* the Falls of the Rhine, by steamer to Cologne, thence to Antwerp for the Exhibition, and home. The party will be accompanied by Mr. C. F. Mitchell, M.S.A., and the fee to Polytechnic students for the fortnight will be 8*l.* 10*s.*

AT the meeting of the Hemsworth Board of Guardians, letters were read from the Public Works Loan Board agreeing to lend the Sanitary Authority 3,200*l.* for the erection of a hospital for the treatment of cases of infectious diseases, 5,000*l.* for Ackworth water supply, and 600*l.* for the extension of the South Kirby sewerage schemes.

THE Leeds Corporation have applied for sanction to borrow 50,000*l.* for the construction of public baths and washhouses, and an inquiry has been held by the Local Government Board.

THE late Mr. John Hill, of St. Margaret's, Streatham, has left a sum of 2,000*l.* for the parish of Newnham-on-Severn. The will directs that the first charge upon the 2,000*l.* is that there shall be provided a clock and chimes for the tower of St. Peter's parish church.

AN inquiry has been held at the Guildhall, Lincoln, into the application of the Town Council for sanction to borrow 27,215*l.* for purposes of street improvement and the formation of a new road, and for works of sewage disposal.

AT the Kersley Local Board Offices an inquiry was held as to the Board's application to borrow 20,000*l.* for works of sewerage and sewage disposal.

AT the meeting of the Aberdeen County Road Board it was agreed that in future contributions from county funds towards

the erection of bridges throughout the county shall only be given when the estimated cost of the bridge reaches 500*l.* It was also agreed that the county contribution shall in no case exceed one-third of the excess above 500*l.*

THE customary Architectural Association students' smoking concert was held at Coleman's Hotel, Covent Garden, on Friday last, April 20. A large number of members mustered on the occasion, and a very pleasant evening was spent under the divided chairmanship of Mr. Cole Adams and Mr. Baggallay, who were supported by Messrs. B. F. Fletcher, A. W. Earle and other visitors. The president, Mr. E. W. Mountford, who was to have presided, was unfortunately prevented from doing so at the last moment, to the regret of all present. An excellent programme was provided by the hon. secretaries, Messrs. E. Graham Simpson and S. Burton Lee, and the students' committee, and many thanks are due to those gentlemen who kindly contributed their services, especially to Mr. C. D. Imhoff, who, to the delight of all who heard him, presided at the piano.

PROGRESS OF ELECTRICITY.

AT the opening meeting of the session of the Institution of Mechanical Engineers, Professor A. B. W. Kennedy, F.R.S., the president, delivered an address on the practical electrical problems of the day. He first dealt with the use of electrical energy for power. As to the transmission of power to a distance, English engineers who wanted to work in this direction would have to study it in other countries. In several towns in the United Kingdom the use of water power for electric lighting would have to be seriously considered some day, but beyond these towns our generation was not likely to see any great development at home. On the other hand, the question of driving tools in a factory by electricity had recently come to the front. In some establishments the saving by the adoption of electricity seemed practically nil; in others, of large size, where no doubt a saving would occur, a considerable amount of capital would have to be spent in making the change. He feared that this would prove a more serious difficulty in the way of the success of the great Niagara scheme than any of those described by Professor Forbes. It was difficult to fix any money value for the convenience of getting rid of the huge mass of shafting, &c., filling the upper half of so many engineers' shops; and the cost of dynamos, leads and motors

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in $\frac{1}{2}$ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London and Contractor.

very greatly exceeded that of shafts and gearing. In cases where electrical energy could be obtained from public mains the comparison was quite different, although it was a question at what rate electrical companies—liable, as they were, to sudden increases in the demand for light, especially on foggy London days—could afford to supply power for other purposes. In regard to the driving of trains and tramcars the situation was by no means so favourable to the use of electricity as was sometimes supposed. Only 35 per cent. of the indicated horse-power of an electrical locomotive was available for pulling the train, against 80 per cent. in the case of a steam-engine. Electricity had forced itself upon the City and South London Railway because of its freedom from foul gases, and in the case of the Liverpool Overhead Railway steam was prohibited. On street tramways probably no form of steam car—even under the Serpollet system—would be generally endured. As to methods of getting the electrical current to the cars, overhead wires might be the best way in country districts, but he hoped that our cities would wait till a practicable underground system had been devised. Meanwhile, electricity was being hard pressed by the cable and compressed gas, of which the latter was far the more formidable rival. Dealing next with the question of public electric lighting, the President observed that the points demanded by the public were that the light should not flicker or go out, that it should be available at all hours, and that it should not be below the declared pressure, nor very much above it. The conditions under which such results were obtained were always varying, and were not only extremely complex in any one place, but were also altogether different in different places. After describing some of the more striking variations he had referred to, he said that some of them came most irregularly and without warning, and all of them very greatly affected both the method and cost of production. When a fog came on, sometimes the work to be done might increase in a few minutes by anything from 500 to 1,000 per cent. It was improbable that the fuel consumption per horse-power in electric-light stations could ever reach anything like so low a figure as had often been reached in first-class steamers, where the engines and boilers worked on continuously day and night at pretty much their most economical load. He considered at some length three points relating to the running of a lighting station—security, economy and efficiency of regulation—observing that to some extent the requirements of security and economy were more or less opposed. Dismissing the use of electricity for physico-

chemical processes as outside his own knowledge, he said that nevertheless, from what he did know, he could not doubt that in this direction electricity had a great future. In this section might be included the application of electricity to heating. So many active and competent workers were engaged on this matter that speedy success was greatly to be hoped for. Not only the difficulty of producing the heat, but also that of producing it in a convenient fashion, had been overcome to a very large extent. The commercial difficulty of producing heat cheaply enough to allow of its general use had not yet been overcome, and until that was done electrical heating, unfortunately, hardly came within our ken, except for very special purposes.

PAISLEY DEAN OF GUILD COURT.

At the meeting of this Court, Bailies Fisher and Robertson on the bench, an application was lodged on behalf of Duncan M'Nair, grocer, to take down the existing buildings at 33 Newton Street and 16 Maxwellton Street, and erect a four-storey tenement of dwelling-houses. The master of works, Mr. Moncur, said he had to take objection to the plans, in so far as the air space behind the tenement would not be in accordance with the requirements of the Act. Mr. John Adam, who appeared for Mr. M'Nair, said he wished to point out that the structure proposed to be erected would be a very handsome one, much in advance of the buildings in the district. So far as the objection was concerned, it was the 170th section of the Act which dealt with the case, and it was stated that the air space behind a tenement should be three-fourths of the area on which the tenement stood. Now, from the position of the site of his client, there would be splendid ventilation, and, from the position of ground behind it, there would be plenty of air space for the tenement. The clause stated that the air space behind a property should be "attached thereto," but did not state that it should belong to the proprietor. There might be plenty of space behind a building, and yet all the ground might not belong to the proprietor of the tenement. On the whole, he held that to refuse consent to the plans would be a straining of the clause, which, at its best, was very ambiguous, and he also submitted that a distinction should be drawn between buildings to be erected on a new line of street and the taking down and re-erecting of properties on existing sites. The matter was then postponed.

NEW PUBLIC BUILDINGS IN KIRKCALDY.

AN extraordinary "boom" in building operations is, says the *Scotsman*, the most outstanding feature in Kirkcaldy industries at present. No less than four important structures of a public nature are either in process of construction or about to be begun, and several new streets and numerous private buildings are also in progress. Nearly all these new erections are situated in the landward part of the burgh, away from what may be called the old town or maritime Kirkcaldy, co-terminous with the sea beach. This latter, however, is still the business quarter, and some new shops and offices are begun, chiefly, as it happens, on the sites of old seventeenth-century houses. Of the four new fabrics of a public character already referred to, the most important, or the largest, at all events, is the Beveridge and Adam Smith Hall and Library, the site for which has been fixed at the junction of Bennoch Road and St. Brycedale Avenue, although the designs are not yet sent in. The second building is intended primarily for the Young Men's Christian Institute, but it will also be commemorative of Provost Swan, a name still held in honourable remembrance in Kirkcaldy. The work is now begun in a prominent position in the centre of the town, with an elevation to the High Street and also to the Kirk Wynd. The plan is by Mr. Washington Browne, and the Institute when completed will have much lightness and elegance, with a dash of picturesque, a prominent feature being a range of windows on the second floor surmounted by gables, which adds largely to the general effect. The internal arrangements include a restaurant in the basement and a billiard-room in the upper storey, the latter a somewhat unusual adjunct to such an institution. The other two structures are directly educational in character—the new high school for Dr. Scott, built on the site of the Burgh School, and an elementary school (Mr. Blackstock's) to take the place of the one vacated. The high school, for which the town is indebted to the munificence of Mr. Michael Nairn, will be one of the most complete institutions of the kind in Scotland, furnishing not only the usual general and classical curriculum, but fully equipped also as a technical school, with laboratories, workshops, and other appliances. The building, in a classical point of view, is a little peculiar in style. It may be described as a large, nearly four-square block of two floors, with a central division projecting considerably beyond the wings. The columns which formed the portico of the old school are now raised to an elevated position on this middle portion, the pediment being nearly on a level with the flat roof.

At present it has considerable dignity in appearance, and when the columns are all in position, the whole structure will gain in character and unity. The elementary school, which is also up and roofed in, has been designed by Mr. Cameron, of Edinburgh, and, although not an imposing work of art, seems likely to fulfil in large measure the requirements of a modern school. It is a long, double, one-storey building of red stone, crossed at right angles by what may be termed three transepts, each of these terminating on both sides of the school with a gable of considerable height, with large prominent windows. These gables, the numerous mullioned and transomed windows, and the high-pitched roof all tend to give individuality to the façade. The building, it is said, will provide accommodation for five or six hundred children. Kirkcaldy may thus, both in a moral and material sense, be said to be lengthening (or broadening) her cords and strengthening her stakes.

AMERICAN PATENT OFFICE.

THE annual report for the year 1893 of the United States Commissioner of Patents has been published. The ground is taken, says the *Scientific American*, that the race retains the power of great conceptions and that the World's Columbian Exposition will make itself felt in stimulating invention. Of recent criticisms passed upon the patent system, those complaining of the inconsiderate grant of invalid patents are treated as most germane to the question of administration of the office. The Commissioner upholds throughout the report the expediency of the office granting only valid patents. A classification division for systematising the records of the history of invention, making as far as possible the scientific and patent literature of the world accessible, is proposed. A salaried force of fifty-two employes is needed for this, some, however, giving but a part of their time to the classification work. The idea is to make the office search for novelty more thorough, and to give the office a higher standing upon the question of invention.

A study of eighty-one court patent cases, in which the patents were declared invalid, was made, and disclosed the fact that in twenty-six the references which defeated the patents were not shown to have been cited by the office, in twenty-nine a part were so cited, leaving twenty-six which were decided on office references. Again, in 988 court cases (1886-92),

436 patents were sustained, and 532 were declared invalid in whole or in part. Of the latter, 428 were declared so by reason of some fault of the office, and 124 on new evidence. The results of a law firm's examination of fifty claims in ten patents held that thirty-five were invalid. The Commissioner cites the above, and he feels that they and their like indicate the necessity for a more thorough search by the office. By classification and indexing the library and records in general, the Commissioner hopes to effect an improvement in the search operations.

Recently three primary examiners resigned. The cases they had passed to issue were re-examined, and in 150 cases the applications were withdrawn from issue upon the ground that patents, if granted for them, would be void. This fact also is cited in the report to emphasise the importance of the classification of records and publications.

Various other points are spoken of. The office hereafter will make photographs of the drawings of patents in those cases where changes in the drawings are required or permitted, and will make the photographs part of the files of such cases. This is an excellent rule, as giving a full record of the original application. Precedence is to be given from the outset to actions upon the merits of applications; requirements in matters of form are to come after the other has been acted on, and after patentable matter has been found. Division of applications is only to be insisted on when an attempt is made to put several distinct inventions in one patent.

The *Gazette* now publishes the claims and principal drawings of patents which expire just before the date of the *Gazette*. This innovation, the Commissioner believes, will be a benefit to the public, partly as giving present subscribers in a sense the benefits of the *Gazette* of seventeen years ago.

The Patent Office exhibit at the World's Fair is alluded to. It has, as far as possible, been kept intact, and is now on exhibition in the Patent Office.

Legislation is recommended in several directions. The price of copies of patents, the Commissioner believes, could in many cases be advantageously lowered. The limitation of the term of American patents to the period fixed by the expiration of foreign patents for the same invention, the Commissioner would have changed, so that an American patent for full term could be granted if applied for within six months of the date of application in any foreign country. Legislation in the direction of establishing a patent bar is also recommended.

The business of the office for the year 1893 shows total net

receipts of 1,242,871.64 dols. against an expenditure of 845,403.36 dols. under the appropriation, with approximately 295,635.09 dols. additional, giving a balance in the office's favour of 101,833.19 dols. There were 38,473 applications for patents, including 1,000 applications for designs and 120 for re-issue. Twenty-three thousand six hundred and seventy patents were issued, and 99 reissued. The patents issued and reissues granted during the year were less than those in 1885, 1889, 1890 respectively. Up to January 1, 1894, 521,700 patents have been granted by the United States, against 817,362 by all other countries. The year 1890, with 26,292 patents and reissues granted, remains the banner year of the office.

An exhaustive report upon the scientific library of the Patent Office is included as an appendix to the Commissioner's report. This gives the history and present condition of the library its scope and the condition of its indexing. An earnest plea is made for more money, and the need of further expenditure for its maintenance seems very clearly shown. During the year over thirty-one thousand journals and articles have been indexed. An appropriation of but 2,500 dols. was allowed for purchase of books and periodicals and for transportation. The present effort is to make an adequate card catalogue with cross references. Within a few months it is hoped that the catalogue of about 100,000 cards will be thrown open to the public.

We cannot let the occasion pass without expressing our appreciation of the ability shown in the report. In some ways it is an innovation, the present Commissioner holding very definite views of his own upon the subject of the administration of the office, and expressing them very clearly. Much of his work is worthy of high commendation, although we cannot agree with him in all his views. The report, curiously enough, illustrates the great difficulty and virtual impossibility of the Patent Office making an adequate examination into the novelty of an invention—an examination which the Commissioner wishes to have a *sine qua non*, in the fullest degree of adequacy, for the issuance of a patent.

WE understand that Mr. Harper Twelvetrees, of Dale Street, Manchester, is now fitting up the laundries at the Corporation Baths, Oldham, and also at the Corporation Baths, Bury.

SOME OF THE PRINCIPLES OF SANITARY BUILDING.*

THE philosophy or science of sanitation embraces so wide an area that it is impossible within the limits of a popular lecture to do more than indicate the elementary principles by which it is bounded. An intelligent knowledge and application of these principles, however, tend to the welfare, happiness and enjoyment of life. The various details of sanitary science so overlap and are so interdependent, that it becomes exceedingly difficult to dilate on one without necessarily trespassing on others. So far as possible I propose to confine my observations in the present address to the hygienic considerations connected with building works, and to illustrate them by means of the exhibits to be found for the most part in this building.

I wish, however, at the outset to remark that by calling attention to any particular exhibit I do not mean thereby to express predilection for it, or to suggest that there are not others equally as valuable for the purpose intended. I allude to some simply as illustrating a type of the material or article suited to accomplish a particular sanitary purpose.

Our progenitors, in pardonable ignorance, worshipped as deities, sometimes with love and sometimes with fear, the then supposed elements—earth, air and water. What more calculated to inspire awe and thankfulness than the work of Mother Earth, repaying with bounteous gratitude labour expended, providing sustenance for man and food for beast? What more terrible than her vengeance when, in return for neglect, she substitutes want for amplitude, famine and misery? So with air, without which life becomes impossible, without which fire could not be obtained, warmth created, nor food prepared; or water, the absence of which is felt in acute suffering, and for the want of which humanity perishes.

We now know that these so-called elements are simple mechanical mixtures of certain simple gases forming the essentialities of our lives, and which demand of us intelligent comprehension, careful use and scientific sanitary application. Properly treated, we recognise these as the best of friends, the most willing and obedient of servants, the kindest of help-mates, but we are forced to acknowledge that when we ill-use them they become enemies to be feared, masters to be dreaded, foes to be avoided.

Now the whole crux of sanitary work may be summed up in one plain English word, "cleanliness." Impurities, whether allowed to exist in the air we breathe, the water we drink, the soil we rest on, the houses we dwell in, the clothes we wear or the body we live in, make for uncleanness, and want of cleanliness is want of sanitation.

Impure surroundings, defilement of soil, tainted atmosphere, polluted water, may not be the *causa causans* of specific disease, but in this nineteenth century experience unquestionably proves that they create a well-favoured nucleus for the growth, propagation and nourishment of most of the ills which flesh is said to be—but should not be—heir to.

Happily it is now mere matter of history, but it may be well to recall to your memory that the serious illness of His Royal Highness the Prince of Wales, the deplorable sacrifice of the lives of our soldiers in the Crimean War, the visitations of cholera and zymotic diseases which have, and do, invade us from time to time, have all undeniably been traced to neglect of sanitary precautions. "It is an ill-wind that blows no one any good," and it is probably due to these circumstances and the practical good sense of Englishmen that we have recognised the evils that bad sanitation engenders, and that we have come to the conclusion "that it is better to prevent than to cure."

If any proof were wanting of the beneficial effects arising from due regard to sanitation I could mention many convincing facts. I will content myself with quoting from Lord Playfair, who tells us that the annual death-rate in London was as follows:—From 1660 to 1680, it was 80 per 1,000; 1681 to 1690, 42.1; 1746 to 1755, 35.5; 1846 to 1855, 24.9; 1871 to 1880, 23; to-day about 19 to 20 per 1,000; and when you recollect the density of population (nearly 5 millions) as compared with 200 years ago, these facts must speak volumes to you.

Dr. Longstaff tells us that London far exceeds in population not only Paris, but Scotland, Switzerland, and even our antipodean colonies. It has double the population of Norway or Servia, nearly double that of Denmark and Greece. Its inhabitants are three times as numerous as those of New York or Berlin. It contains more people than Paris, Berlin and Brussels taken together, while it nearly doubles the united inhabitants of New York and its neighbouring cities of Brooklyn, Hoboken and Jersey; and Greater London added, it exceeds that of Sweden and is fast approaching Ireland. An appalling statement is made that the city is still gaining at the rate of 50,000 a year, 1,000 a week, 150 a day.

Wherever sanitary amendments have been introduced a decrease in the mortality of the people has uniformly followed. In the city of Salisbury the mortality fell from 28 per 1,000 to 17 per 1,000, and the death-rate from phthisis alone was reduced by no less than 49 per cent. If this be calculated you will at once see the number of lives spared, the sickness alleviated, and the poverty avoided.

I need not labour this more. I take it for granted that no person claiming intelligent appreciation can or will question the permanent advantage and the absolute necessity for sanitary considerations in our everyday life.

I can tell you little that is new, but I propose to direct your attention to those salient matters to which I have referred, and in the order in which I have placed them—earth, air and water—merely, however, adding that the complicated necessities connected with our building form only a fringe of the subject, that drainage and plumbing are not, as it is thought, "the Alpha and Omega" of hygienic considerations, important as they are, for our clothing, our personal cleanliness, our physical condition, the freedom from disease and non-adulteration of our food, whether raw, cooked or manufactured; care for public sanitation, such as roads, open spaces, overcrowding, factory regulations as carried out by municipal authorities—these all and many more are essential to the hygienic welfare of the community and to the production of those conditions which make life long, enjoyable and free in a large measure from the misfortunes of poverty and consequent anxiety.

The legacy of insanitary conditions which has been bequeathed to this generation has stimulated our inventive faculties and produced keen competition, so that if we avail ourselves wisely of opportunities offered we can select our materials to suit our various requirements, and at the same time our pockets. However, our one governing principle must be that by which the Vicar of Wakefield selected his wife, viz. he chose her, as you may remember, "as she did her wedding gown, not for a fine glossy surface, but for such qualities as would wear well."

Just a word as to drainage. Owing to faulty construction of sewers, such as bad gradients, decaying brickwork, saturated surroundings, it becomes easier for us to prevent than to avoid inevitable mischief which must arise if the interiors of our houses are placed in direct communication with the sewers. The exhibition is full of suggestions and materials for carrying this into effect, and I am glad to record that, after twenty-five years' hard work, this part of sanitary work has become recognised by the powers that be, and that from the Local Government Board downwards measures are taken to prevent the foul air of sewers from penetrating from the bowels of the earth to the interior surfaces of our dwellings. The whole matter lies in a nut-shell. Cut off all connection with the sewer by means of an efficient syphon trap (a real, not an illusive one), with proper cleaning cap, run your drain-pipes in straight lines with proper falls thereto, and interpose an intercepting chamber. Take care to introduce air to this, and put glazed open pipes to receive the soiled water before it enters the syphon; wherever there is a change in the direction of the pipes put an inspection-chamber, or chambers, so that the works can be easily examined. There is no such thing as finality, and you must not anticipate that any arrangement will last perfect for ever; therefore the system should not only be inspected and re-inspected, but cleansed and amended if necessary periodically. Pipes should be of best tested earthenware or strong and heavy iron. Samples are to be seen in this exhibition.

Drainage is immediately connected with plumbing works; for all this kind of work the best material is the cheapest. Soil-pipes should never be of less weight than 7 lbs. lead pipe, or strong cast-iron, barfed, or coated with Angus Smith composition; they should be open at top, and should be the means of thoroughly ventilating the whole system. W.C.'s are of many types; those that are self-cleansing are the best—their names are legion. To point out merits or defects would occupy time, and would weary without perhaps interesting you. It is perhaps scarcely necessary to add that pan closets and D traps are not permissible.

I must not be tempted to do more than thus briefly epitomise these subjects, which might fairly form the subject of another lecture. I mention them to show that they have not been forgotten. You will see that earth, air and water are all so intimately incorporated with my subject that I cannot well separate them in the following remarks, but if you will favour me with your attention you will note that they follow each other in logical sequence.

Now, as to foundation or texture of site upon which we have to build. Obviously this is one if not the most crucial of considerations equally applicable to all kinds and descriptions of building construction. With your permission we will dwell a little time upon the discussion of this important subject, particularly as it is one whose defects cannot easily be remedied if once adopted. Dr. Parkes points out that soils affect health by the air and water in the soil, its solid constituents, its conformation, and presence or absence of vegetation. A little local

* A paper read at the National Building Exhibition by Mr. H. H. Collins, F.R.I.B.A., F.S.I., and Fellow of Sanitary Institute of Great Britain, &c.

geological knowledge will assist us much, and this may be supplemented by direct local observations. Railway cuttings may be visited with advantage, excavations examined and records of them obtained, wells observed and useful information as to fluctuation of depths be sought for, and lastly, by sinking trial holes to 10 or 15 feet below surface of original level of the soil. The soils to be dealt with will probably be gravels or sandy, or those containing much sand and a small proportion only of clay.

Stoney clays and peaty soils absorb and retain moisture, and are scorched by summer heats because heat causes clay to contract and prevents access of air. Damp lands are of course cold by chemical evaporation of their moisture carrying off heat.

Clay soils are cold and damp and, Dr. Parkes tells us, engender rheumatism and catarrhs.

Sands favour great heat unless covered by grass; they radiate heat, and therefore the air over them is hot by day and night, and heat, you know, is a powerful factor in production of malaria and many diseases.

Here let us pause just to suggest one of the practical remedies for avoiding the evils which the above considerations and our own experience show to exist. Obviously the first thing to do is to drain our damp and ungrateful soils, such as clay soil and sand soils full of water, which lie on the impermeable soil beneath. I have already mentioned some well-worn vital statistics as to marvellous improvements to health of homes and localities where drainage and water supply have been duly attended to, but the physical results to the soil where works of this nature have been executed may be worthy of your attention. It has been found that the mean annual temperature of arable land has been raised nearly a degree by drainage, and, that the temperature of hill pasturage has been similarly affected. That during sudden falls of temperature and protracted cold, the cold passes more quickly and completely through undrained than from drained lands. That when the temperature of the air is higher than that of the soil, the drained land receives more benefit from the higher temperature than the undrained, less of its heat being lost by evaporation; so also superfluous rain and sleet soon run away from drained land. Thus by draining land you see we procure that which nature is always (and with success) striving to obtain, viz. equilibrium; that is, to maintain the soil at a comparative equal temperature. Undrained land is liable to continuous fluctuations, for when saturated with warm rain-water its temperature is temporarily raised, and when with melted snow it is temporarily lowered, and these alterations are as bad for the land as those who have to dwell on its surface.

According to Buchan the temperature of drained land has been sometimes raised 30 degs. over undrained land, often 20 degs. and frequently 150 deg., and he says the beneficial effect has been as great as if the land had been transported 100 to 150 miles southward.

But the soil has yet another dangerous attribute. It is one of nature's scavengers. Through its interstices runs the high road to disease. It is the conductor of air and water, and it influences not alone the atmosphere and life of its surface, but likewise considerable depths of its interior. Mr. Baldwin Latham has made the subject "the ground water" in the soil his own, and he has irrefragably proved that to its appearance or not may be traced many of the various zymotic diseases which from time to time become unpleasant and dangerous visitors amongst us. Ground water we can see and appreciate, but it is accompanied by its equally dangerous companion, ground air, which is invisible to sight, although its good or bad effects are equally manifest.

Professor Pettenkofer, of Munich, has given convincing outlines of the effects of ground air in its relation to the soil which I will try and epitomise for your benefit.

Adopting a rubble soil, gravel or sand, upon which we build some of our best and heaviest structures, as an example, he takes a measured bottle and packs it slowly and compactly with gravel. He then fills it with water, and finds that at least one-third of the contents of the bottle has been occupied by air, and of course the water has now taken its place, proving that a gravel foundation consists of two parts of gravel and one-third part of air, and this air, as we shall presently see, is in direct contact with the house which stands on its surface. He shows that sand, clay, stone, &c., are possessed of similar qualities, and by way of additional proof points out that various stones are used as filters. When a soil has pores partly filled with air and partly with water, it is called damp. When all passages of air are filled up with water, the degree of humidity is called ground water. Air and ground water are in continual circulation. To show you this he fills a cylinder with gravel, and by connecting it with a manometer he blows gently on the surface of the gravel; the liquid in the manometer begins to move; by blowing directly on the gravel and allowing the air to pass out freely the flame of a candle is extinguished. Air is thus proved to the senses to move freely through porous soils. Difference of temperature and diffusion

produce the same movements. Now, if air and water can thus travel and circulate underground, it is clear they can carry with them impurities, and if the house is in contact with the soil, and the air of the interior is warmer than that of the exterior, it will pump into the house the impure air, which has had impurities dissolved in it through the solvent action of the water and decayed organisms in the soil. There is no lack of instances of this kind at home and abroad where infected ground air and water have carried disease and misfortune into many and many a home; unless the ground be pure its emanations cannot be. The Caterham fever was caused by the water supply being contaminated. In the Swiss case of Lausanne, some miles existed between the source of the disease and locality affected. Dr. Hime relates how a man was seized with a serious illness, nature and cause being inexplicable. The sisters who nursed him were taken with the same symptoms. A friend who visited him said there was an escape of gas; this was derided by attendants and doctors, &c. At length an inspector of the gas office made an examination and confessed to having found an escape, but could not discover the source. The patient left the house and recovered. No sooner had he left the house than the fire was let out and the windows thrown open; then his neighbour was seized with the same symptoms. He too recovered by a rapid flight. At the end of some days a further examination discovered an escape of gas from the main pipe, which ran down the centre of the street some 20 feet away. The coldness of the weather had necessitated large fires in the house, and the increased heat developed a current of air from the ground to the house, the gas being sucked up with it. When the patient had left, the house cooled down and the current was diverted into the apartment of his neighbour. Similar instances have been related by Mr. Rogers Field, notably in the case of the Duchess of Connaught, &c.

Not only have the decayed vegetation and other organisms in soils to be taken into account, but we must recollect that we have to deal with made ground from which pure gravel has been removed and impure rubbish substituted, and filled with material peculiarly calculated to create mischief, such as vegetable refuse, decayed paper, wood, oyster shells, bones, rotten cloth, egg shells, &c. Now, if gases and air are insidious in their progress, water is none the less so, and prepares the food to contaminate the air. Distance is no deterrent, neither vertical nor lateral. Professor Geikie relates that in sinking deep wells leaves and other plants have come up with the first gush of water from depths of 400 feet. These organic remains, he tells us, were comparatively fresh, and were supposed to have travelled in underground channels from hills 150 miles distant and to have been three or four months on their subterranean journey. Even fresh fish have been brought up from depths of 170 feet. This may afford some explanation of the importation and propagation of cholera. So with dust in air. Tyndall discovered dust in the high Alps, and Geikie calls attention to the following statement, that during an eruption of one of the volcanoes in the island of Iceland, a fine impalpable dust fell in such quantities between Orkney and Shetland Islands that vessels sailing there required to have deposits shovelled off the decks every morning. The crops in Caithness proved a failure owing to the quantity of volcanic matter which fell on the ground, the distance from Caithness to Iceland being 600 miles. Many other instances can be given. In 1835 a similar circumstance occurred from a volcano in Guatemala, the fine ashes of which were carried 800 miles from the emission, and Darwin, in the "Voyage of the *Beagle*" in 1845 found that the atmosphere of St. Jago was associated with a fall of dust so impalpable and fine that it rested in the air as a haze of light fog. He found that the dust must have originated 1,000 miles away from the adjacent coast of Africa; it had been four days on the journey and had travelled 200 miles a day.

I could multiply these anecdotes *ad infinitum*. Now, rain in its descent takes up air, and consequently any impurities which may be contained in it. Water, when it has passed through soil, is impregnated with various substances, and this can be readily seen by evaporating the water and examining the deposited remains left at the bottom of the evaporating vessel. It is common knowledge that carbonic acid, mineral waters, sulphuretted hydrogen, carbonates of lime, soda and magnesia and chlorides are found. Then you have also ferruginous or chalybeates medicinal water, as at Bath; sulphur and magnesia water, as at Harrogate; carbonates of sodium, &c., at Buxton, Vichy, Carlsbad and Wiesbaden water, &c.

If I have wearied you with emphasising this part of my address it is because I conceive it to be most important to sanitary construction. You will see by the diagram taken from Dr. Pettenkofer's classic on cholera the result of sixteen years' close study and experience of ground water in Munich, and you observe that just as the ground water sank in the gravel soil of Munich so did fever rise. Pettenkofer points out that it would be incorrect to suppose great porosity of soil allows everything to flow through it; unfortunately, though it does allow of a flow of ground water, it also acts as a filter, which

retains things which it would be a blessing to have removed far away.

There is active and uninterrupted communication between the air of our houses and the ground beneath them. When, therefore, organic matter liable to putrefaction becomes deposited in the ground it is just like a dead body which we bury and leave to decompose. The more contaminated, the more impregnated the soil of a place is, the more does it favour outbreaks of typhoid fever and cholera. What is necessary to be done is here also to prevent fluctuation, or rather to obtain an even fluctuation, and so keep the ground water all the year round at the same level—at a level 15 feet below the surface (De Chaumont says if it is 5 feet it is persistently unhealthy), to prevent infiltration of organisms into the soil, and this can be done, as it has been done, by effective drainage and proper sanitary administration. A clay soil resting on a gravel foundation, through which ground water never rises sufficiently high to reach the clay, is unsusceptible to cholera. Mr. Ernest Hart has designated the preventable disease of cholera, in a very able and pleasantly-written paper in the *Nineteenth Century*, as being "a filth disease carried by dirty people to dirty places." This terse epigrammatic sentence is applicable to most of the zymotic diseases with which we are infested. Sir Charles Cameron, in his recent address at Portsmouth, corroborates these statements; he says, "to soil-pollution I attribute the prevalence of typhoid fever." We should be as particular with respect to the purity of our soil under our houses as we are with regard to the purity of air which surrounds them. He mentions that in Dublin during the last ten years 1 person in every 164 living on clay soil had typhoid fever, whilst 1 in every 92 living on gravel soil contracted the disease. This is occasioned when the soil becomes dry, and is more frequently the case with loose gravels than with impenetrable clays. Now the lesson I would ask you to learn from the above brief facts is that it is absolutely necessary, after proper drainage, to hermetically close down and so prevent all access of ground air to the house by amply covering the whole of the site with at least 6 inches thick of good hard concrete, composed of clean washed ballast gravel and Portland cement, and to float the surface with a coating of cement.

Most of the by-laws of the principal towns demand something of this kind, as also those of the London County Council, but the material used is singularly inefficient both in quantity and quality.

Having, however, sealed down the ground air and water we must proceed a step further; we must prevent any contact of our dwelling with adjacent ground. Various ways are open. Thus, we can put an open and wide area round our house, building the walls with hard bricks set in Portland cement. We can put a dry area similarly constructed and properly drained and ventilated.

We can build our walls hollow, or put between their outer and inner surface an impermeable material, such as hygienic rock cement or Seyssel asphalte. Or we can line vertically to a sufficient height above the soil with best Seyssel asphalte about 1 inch thick, and put on in two layers; or if we are much pressed by economical considerations, then we may use granolithic cement or a good Portland cement, at least 1½ inch thick, floated in to an even surface, preferably laid on a double course of tiles breaking joint. But we have not yet got a quite sure foundation for our house. We have to prevent what is scientifically known as capillary attraction, or what is popularly described as the rising of damp in and round the walls of the house. Capillary attraction (so called from the hair-like tubes) is caused by an automatic suction dependent on temperature, atmospheric pressure, and formation of the material through which it passes. A familiar example is a piece of cotton, which will empty a vessel. The model shows that it acts in direct proportion to the areas of the tubes through which the water, &c., passes. Ample appliances are at hand. We can use hard slates (bad absorbers of damp) in two layers breaking-joint, and set in cement (and this we can apply to rectify the defect in existing walls by cutting through the wall, underpinning with the slate courses). We can use a 7 lbs. to the foot superficial lead course, very desirable with stone walls. We can employ blue bricks of best hard and impermeable character. Or we can avail ourselves of asphalte (not pitch or other squeezable material) 1 inch thick. Or, lastly, we can insert one of the numerous glazed earthenware damp courses, of which this exhibition is singularly deficient, but of which Doulton and Cliff manufacture numerous kinds. A word of caution: never allow any of the so-called patent feltings, waterproof compositions, inferior asphaltes, such as pitch, &c., to be used. The former invariably rot and occasion settlements in the buildings, or become quite useless in a few years; the latter, if of any use at all, have no lasting qualities. Sanitary work must be well done or it is not sanitary.

Furnished with a properly protected and well selected site, and having shut off all possible access either of ground

water, damp, or impure air, we proceed to enclose the same and form a house or other structure, carefully proportioning our foundation so as to afford a broad base for our walls, and we calculate the weights to which we may subject the specific soil upon which we are about to build. We recognise that if we do not insure stability to our structure we shall insure hereafter shakes and settlements, and this when perhaps it is too late to remedy means insanitary construction.

Now the primary functions of our enclosures are:—1. For shelter against heat and cold. 2. For the admission of properly tempered air. Let us glance at the philosophy of the subject in order that we may correctly understand our work. Heat is propagated by conduction, by radiation, and by reflection. Our walls act as our clothes; and, indeed, the walls of the house are the principal garments of the body. Many garments afford sufficient warmth—thick walls sufficient heat. All bodies are more or less porous; those least so are of course the densest. Now various bodies possess different facilities for conduction of heat. Dense bodies are good conductors; their particles being closest together easily communicate heat to each other. Porous bodies are imperfect conductors; stone transmits heat comparatively rapidly, brickwork does so less, and plaster less still, and glass stands somewhat intermediate.

Radiant heat passes directly through air without heating it; it is absorbed by walls, &c., and is again radiated to the air until equilibrium is established. The radiant and absorbent powers of materials are equal to each other. The heat received from the sun is an example of radiant heat, which travels 95 millions of miles through space. Reflected heat does not heat the body upon which it impinges, but sends it back from whence it came. Another effect of heat is evaporation, which by abstracting heat causes great cold or absence of heat.

Familiar examples of good conductors are metal instruments, which conduct heat so quickly that we are obliged to use wooden handles, which are bad conductors, in order to hold them. Metal tea-pots and kettles have wooden or porcelain handles for same reason. Water is a bad conductor, can be heated from top, and takes long time to conduct heat below its surface. Glass is a bad conductor. We may heat a rod into fusion, and hold one end in our hand whilst so doing. So with clay, terra-cotta, &c., and plaster. Wood beams char long before they burn, and we enclose good conductors, such as iron, &c., with plaster, the latter being a bad conductor. Paper may

be rolled round smooth brass bars and placed over gas; the heat is conducted away so quickly that the paper is not even discoloured; placed round wood the paper would be quickly discoloured, being so bad conducting power of wood. Bad conductors are, however, good radiators, and this is why newspapers are used as coverings to the bodies with such good results.

If water can be absorbed or pass through walls, so can air, because air is 770 times lighter than water. It is very easy to make a watertight compartment, but very difficult to make an airtight one.

[Here was shown and explained Pettenkofer's experiment showing air passing through mortar and brick cylinders.]

Water is a bad conductor, as shown by above experiment. Sandstones are so porous as to allow water to pass easily through them. As the pores of the materials are filled with water they become impervious to air, therefore airtight walls are synonymous with wet walls.

Suppose that 100,000 bricks are used in a building, each weighing 10 lbs, then there will be 10,000 gallons of water to be got rid of before the wall can be said to be dry and the house habitable.

Damp and wet walls impede ventilation, prevent diffusion of the gases through their pores being sealed. They disturb the heat economy of our bodies by abstracting heat in the one direction, by radiating our heat towards them; they absorb heat by evaporation; they are better conductors of heat than dry walls, just as are wet garments, and consequently raise our heat losses by a one-sided and increased radiation. Therefore diseases caused by cold are frequent in damp houses, such as rheumatism, catarrh, Bright's disease, &c. Superfluous heat must be got rid of by evaporation into and by the air; the capacity of the air for receiving vapour depends on its temperature, on the quantity of water it already contains and on the velocity with which it travels over the surface of the wall.

Time must be given before a new-built house ought to be occupied, and regulations should be made to prevent occupation until its hygrometrical conditions are such as to warrant its being inhabited. A wall may appear to be dry—why is it that oftentimes after inhabitation damp appears? Pettenkofer shows that damp spots arise from the precipitation of water from the air on the walls. He remarks that the inhabitants of houses besides giving off water and vapour from their lungs and skin do so by numerous household manipulations, such as cooking, washing, cleansing, &c. Then if the air of the

house is already saturated with water in proportion to its temperature, a small degree of cold is sufficient to produce dew or a precipitation from the vapour, as we see it on window panes or varnished papers. The porous wall can, however, imbibe a good deal, and in old houses we may see windows, &c., sweating whilst the walls seem perfectly dry. The walls go on condensing water till their pores are full and all air expelled, then not slowly or gradually but all at once numerous damp spots appear. The walls have just lost enough of the building water to allow air to occupy part of their pores. Optically they seem dry. Very little water is required to choke their pores, and wherever this appears damp spots break out. A fire is a good cause. The heat from it begins by heating places nearest to it, and by evaporating water saturates the air of the room, but at a distance from the fire the walls being cold the vapour of the air condenses. Dew falls, and if the pores of the walls still contain quantities of building water they begin to overflow.

What are the functions of walls? The removal into the open air of the watery vapour, caused and developed by the occupants of the house, to pass it through them and to allow it to evaporate on their outer surfaces. Porous materials can, therefore, only make dry dwellings. A workmen's building was once constructed of iron slag; as soon as the workmen inhabited it damp began to manifest itself, until at last it became so wet as to be uninhabitable. The only way to quickly dry the house is as I have said; and to do this, to heat all stoves and allow continual passage of warm air through the rooms or thorough ventilation. Walls must be kept clean; porous walls can absorb into their interstices organic and other impurities, which decay and cause the walls of houses, hospitals, &c., to become sources of disease.

We must of course use the materials we have at hand, but we must select and apply them according to the teaching of sanitary science. First we must obtain a good, dense and evenly-grained stone, or a hard, well-burnt, dense brick, for our walling, and we must take care to cement them together with good mortar. We thus provide good conductors and ventilators for our dwellings. But as the outer side of our walls may become impregnated with water, or may be cooled by evaporation or heated by sun, we must temper these effects by covering them with an imperfect conductor, such as plaster, and a good radiator, such as paper, again over this. If the walls be cold and damp, without these precautions we have the water evaporated and condensed on the surface, a not infrequent nuisance, due to neglect of these considerations. And if we varnish or polish

our walls, a similar condition arises and from a similar cause. To graduate conduction and to keep our walls dry and warm, we must make them of sufficient thickness. A wall may have sufficient stability; and yet be a most unhealthy one. In fact the walls themselves must be clothed as we clothe our bodies, and for the same reasons. The various Building Acts of Parliament in this country have been designedly and admittedly drawn not from a sanitary standpoint, but to insure stability and prevention of fire, and clearly no walls in an inclement and variable climate such as ours should be permitted of a less thickness than 14 inches thick.

A well-built thick brick wall is, therefore, a good one, and brick is a desirable material to employ; it is dry, admits a considerable amount of spontaneous change of air, and it absorbs and radiates heat. Of course there are many forms and various constructions of walls, hollow, glazed brick, terra-cotta, &c., to explain which would require more time than is at our disposal, but the above remarks apply to the construction of all, and many examples are to be found in this exhibition. We have now only to finish our wall. We have kept his feet dry. We have protected his body by proper construction and material, and we have now only to shield his head from inclemency of weather. To do this, we must cope it with hard, sound, blue bricks built in cement, and must not forget in such case to throw the water from its surface by tile creasings or other damp-proof projections, else by saddle-bricks, or by hard, not porous stone coping, properly weathered and throated. We may weather cement the top, or lastly may project the eaves of the roof over the walls when Acts of Parliament will allow of our so doing.

Having built our walls and enclosed our space, we must now cover it in by roof or flat covering, and the same principles which apply to walls will equally so to roofs. We want above all a dry covering impervious to wet and cold, a covering which will keep us warm in winter and cool in summer, again seeking for that equilibrium of temperature so essential for the preservation of health and sanitary construction.

We have an abundant choice of materials—good homogeneous slate which must be free from argillaceous properties, else it will soon absorb wet and decay; tiles of dense quality, well pressed; either of these materials should be laid with ample lap and on good seasoned boarding and wood fillets. To prevent conduction of heat a non-conducting substance should be inserted between the boarding and covering. Lead or zinc laid on asphalted felt or paper to proper falls makes

THE BLACKMAN VENTILATING CO., LD.,

a very good covering, but care must be taken that they are not only of good quality but of requisite thickness, and so laid as to allow of expansion and contraction. Lead should not be less than 6 lbs. to the foot, of well-milled and soft quality, and zinc should be of Vieille Montagne manufacture, weighing not less than 21 ozs. to the foot superficial. The boarding should be laid the way of the lead or zinc. We may have flat roofs formed of steel or iron joists filled with breeze cements and covered with Seyssel or Val de Travers asphalte. Inferior asphalte must always be avoided, it invariably develops into a leaky covering. We may also employ Portland cement coverings laid on a double course of tiles, breaking joints, but this covering is not to be recommended except on economical grounds. It would be impossible to furnish more than these outlines for your guidance, but study and experience will fill in the detail; rest assured, however, that to make even a tolerably perfect sanitary house, each portion must and will demand equal attention and precaution.

(To be continued.)

VENTILATION OF THE HOUSE OF COMMONS.

IT has been recommended that the ventilation should be altered by (1) the substitution of silent-running open fans, or propellers, of similar form to those already in use in the building for the coke fires, which are now kept continually burning at the base of the various shafts in the towers; (2) the filling of the present steam pipes with water, and the heating and circulation of the water by means of the steam; (3) the utilisation of Tobin tubes in the committee-rooms for the purpose of securing a more equable diffusion of the fresh air admitted through the floor; and (4) the formation of extract shafts under the side galleries in the legislative chamber, with the object of purifying the air breathed by members sitting on the back benches and by the occupants of the various galleries.

THE IRON AND STEEL INSTITUTE.

THE programme of the Institute meeting to be held at the Institution of Civil Engineers on May 2 and 3 has just been issued. Mr. Windsor Richards will preside. Some of the papers to be read and discussed will excite great interest in the iron districts. Professor J. O. Arnold, in a paper on the "Physical Influence of Certain Elements upon Iron," will attack some of the theories of Mr. Roberts-Austen; Mr.

William Hawdon will describe an entirely new departure in the construction of blast-furnaces; and Mr. Jeremiah Head will point out the growing importance of Scandinavia as a source of iron-ore supply. Mr. D. Selby-Bigge will discuss the uses of electricity in the way of replacing steam and other motors in the iron and steel industries. Mr. G. J. Snelus will explain a new French process, a sort of Bessemer process on a small scale. An important paper on the relations between the chemical constitution and ultimate strength of steel will be read by Mr. W. R. Webster; and Mr. J. E. Stead and Mr. H. K. Bamber will respectively discourse on the microscopic examination of iron and steel and the analysis of steel.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

6996. Robert F. Dampier, for "Improvements in and connected with windows."

6997. Henry George Hellier, for "Improvements in sash-fasteners, applicable to windows and doors."

7000. Albert Thomas Butler, for "Improvements in window frames."

7084. Walter Vaughan, for "Improvements in or connected with water or other liquid tap-fittings."

7154. George Herbert, for "Improvements in scales."

7337. James Fred. Tonkin, for "Improvements in door locks."

7355. Nimrod Simmons, for "A new and improved detachable joint for water-pipes, soil-pipes and sewers."

7356. Nimrod Simmons, for "A new and improved detachable flushing-valve and water-closet attachment."

7407. Edward Morley, for "Improvements in fire-escapes."

7449. Max von Koppelow, for "Improvements in safety locks."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

CHESHUNT.—May 5.—For Drainage and Water-Supply Works to Six Villas. Mr. James Bunce, Turner's Hill, Cheshunt, N.

CHISWICK.—May 16.—For Sewering and Making-up Prebend Gardens, St. Mary's Grove, Gordon Road and Eunice, Road. Mr. Arthur Ramsden, Vestry Hall, Tottenham Green, N.

CLAY CROSS.—May 8.—For Building Board Schools. Messrs. Rollinson & Son, Architects, 13 Corporation Street, Chesterfield.

CLAYTON.—May 5.—For Building Eight Scullery Houses. Mr. Sam Spencer, Architect, 344 Great Horton Road, Great Horton.

DARLINGTON.—May 9.—For Stations and Buildings for Railway Extension. Mr. Ernest E. Meek, Secretary, Darlington.

DEWSBURY.—May 9.—For Building Residence. Mr. W. Crawshaw, Architect, Market Place, Batley.

DOWLAIS.—May 5.—For Building Church, Pengarnddu, and at Pontclown. Mr. E. M. B. Vaughan, Architect, Cardiff.

DUBLIN.—May 7.—For Additions to Institution for Imbeciles, Palmerstown. Mr. G. P. Beater, Architect, 17 Lower Sackville Street, Dublin.

EAST COWES, I.W.—May 8.—For Sinking Well, 135 Feet deep, in Brickwork and Cast-iron Cylinders, and Building an Engine House; for Supplying and Fixing an Oil Engine, Three Throw Pumps and other Machinery. Messrs. Lemon & Blizard, Castle Lane, Southampton.

EAST STONEHOUSE.—May 10.—For Additions to Police Station. Mr. E. H. Harbottle, Architect, County Chambers, Exeter.

ESKDALE.—May 14.—For Building House. Mr. John Butler, Architect, Barrow.

FULHAM.—May 9.—For Making-up and Paving Turneville Road. Mr. J. P. Norrington, A.M.I.C.E., Surveyor.

GALASHIELS.—May 14.—For Building Post Office. H.M. Office of Works, Edinburgh.

GLOUCESTER.—May 4.—For Erection of a Waggon-repairing Shop for Midland Railway Company. Mr. James Williams, Secretary, Midland Railway, Derby.

GODALMING.—May 7.—For Building Technical and Art School. Mr. Samuel Welman, Borough Surveyor.

HOOLE.—May 11.—For Repairs to Workhouse. Mr. R. C. Davies, Architect, 24 Newgate Street, Chester.

HUNSTANTON.—May 10.—For Building Detached Residence. Messrs. George Fill & Co., Architects, 1 Queen Street, Norwich.

ILFORD.—May 8.—For Construction of Swimming and Slipper Baths. Mr. John W. Benton, 3 Cranbrook Road, Ilford.

IPSWICH.—May 22.—For Additions to Board School. Mr. T. W. Cotman, Architect, Northgate Street, Ipswich.

JACOBSTOW.—May 9.—For Building Board School. Mr. O. B. Peter, Architect, Launceston.

LAKENHAM.—May 5.—For Building Four Dwelling-houses. Messrs. George Fill & Co., Architects, 1 Queen Street, Norwich.

LEWISHAM.—May 8.—For Kerbing, Tar Paving, Metal-ling and Channelling Works. Mr. Edward Wright, Board of Works Offices, Catford, S.E.

LEWISHAM.—May 8.—For the Supply of Road Material. Mr. Edward Wright, Board of Works Offices, Catford, S.E.

LIVERPOOL.—May 9.—For Taking Down and Rebuilding Warehouse. Mr. T. Houghton, Secretary, Euston Station, London.

LLANGADOCK.—May 10.—For Repairing Church Tower, &c. Rev. Wm. Rees, Vicarage, Llangadock, R.S.O.

LLANGFNI.—May 22.—For Erection of County Buildings. Mr. J. L. Griffiths, Clerk of the Peace, Holyhead.

LLWYNPIA.—May 12.—For Building Church and Hall. Mr. E. M. B. Vaughan, Architect, Cardiff.

NEWBURY.—May 7.—For Construction of Cattle Shed. Mr. E. A. Strickland, Borough Surveyor.

OULTON BROAD.—May 5.—For Building Temperance Hotel and Boarding House. Messrs. George Fitt & Co., Architects, 1 Queen Street, Norwich.

PORTLAND TOWN.—May 7.—For Painting, Colouring, &c., at St. John's Relief Station, Culworth Street. Mr. H. T. Dudman, Guardians' Offices, Northumberland Street, Marylebone Road, N.W.

STOURBRIDGE SCHOOL OF SCIENCE AND ART.

A SCHEME has been suggested at Stourbridge for the erection of a new school of science and art in the town. The Worcester-shire County Council have promised 600*l.* towards the outlay on the school if at least an equal sum is subscribed locally. It is thought undesirable to spend any money on a building on an objectionable site, but the endeavour may be made, if possible, to erect a school in a better position. Rough plans have been prepared for very complete accommodation for science and art teaching in Worcester Street. These involve an estimated expenditure of 7,000*l.*

WE are asked to state that Messrs. Heelis & Wrightson, surveyors, of 26 Budge Row, Cannon Street, E.C., prepared the quantities for the Masonic Hall, Newcastle-on-Tyne, also for the Leyton Public Offices and Technical Institute, which was omitted in error when the tenders were forwarded.

TRADE NOTES.

MR. C. G. ROBERTS'S patent automatic horizontal rain-water separator, to which we have often drawn attention, was reserved "for further practical trial" by the judges at the Portsmouth exhibition of the Sanitary Institute in 1892. After rigorous trials they have recently awarded a medal to Mr. Roberts's invention.

THE master joiners of Newcastle, Gateshead and Tyneside have decided to grant an advance of a halfpenny per hour to the wages of the operatives.

AT St. Helens a threatened strike in the building trade has, it is said, been averted. The demands of the joiners have been referred to arbitration. The painters' dispute had previously been settled.

THE wife of Colonel Helsham-Jones, Redlands, Surrey, has presented a new eight-day turret striking clock with large external dial to Birstwith village in memory of the late Mrs. Greenwood, of Swarcliffe Hall, near Harrogate, which has been erected outside the village schools, Birstwith, the clock having been made and erected by Messrs. W. Potts & Sons, clock manufacturers, Guildford Street, Leeds.

THE contractors, Messrs. Eckersley, Godfrey & Liddelow, for the Piræus-Larissa Railway have sent a protest to the Greek Government, in consequence of the action of the Government with regard to the railway. The contractors, on the reasons upon which the forfeiture of their rights was sought to be based, say:—"These pretenses are both unproved and untrue. The stoppage of the work was not brought about by us, but by the Government. We never in any way declared to the Government that we had not the means to carry on the work, and our company neither is nor was bankrupt." The contractors now demand from the Greek Government the return of the caution-money of 2,000,000 francs in gold, the retentions made on work executed amounting to about 2,150,000 francs, damages for contingent profits, and various payments for material and rolling-stock, &c.

BUILDING AND BUILDERS.

THE report of the sub-committee appointed with regard to the Northern Hospital and the David Lewis Trust has been adopted by the finance committee of the Liverpool Corporation. The report recommends the Corporation to grant to the committee of the Northern Hospital a piece of land at the north-east end of Gibraltar Street, also a strip of land situate between the site of the present hospital and the Lancashire and Yorkshire Railway, and that the Corporation contribute 15,000*l.* towards the rebuilding of the Northern Hospital.

THE Glasgow city engineer has prepared a plan for the proposed People's Palace on the Green. From the designs, which have met with the approval of the committee of the Town Council appointed to consider the question, it appears that the Palace will consist of a front building, containing two large reading-rooms, a museum, and a picture gallery; and at the back there will be an extensive glass-covered winter garden. A site has been secured to the south-east of Greenhead Baths, and the principal front will face the London Street entrance to the Green. The total cost is estimated at 19,000*l.*

PLANS for a proposed addition to the infirmary are being prepared by Mr. Wild, architect, for the Penistone Board of Guardians.

IT is proposed to pull down the old drill-hall at Kirkgatehead, Irvine, and utilise the site for the erection of a hall in connection with the parish church.

THE WEIRD LADY.

WEST-COOMB, SUSSEX.

WAREHOUSE, BIRMINGHAM.

VARIETIES.

THE Sheffield and Yorkshire Navigation Company have signed agreements with the Manchester, Sheffield and Lincolnshire Railway Company for the purchase of their water-ways. Immediate steps will now be taken to construct a ship canal from Sheffield to the sea, which has long been desired in the trading interests of the district.

AT Colne a Local Government Board inquiry has been held respecting the Local Board's application for sanction to borrow 11,500*l.* for gasworks purposes. It was stated that the Board purchased the gasworks in 1877, when the population of the town was 9,000, for 33,000*l.*, and had expended altogether 67,000*l.* upon the gas scheme. The works had been remodelled. The Board had provisionally accepted a tender for the new holders for 6,100*l.*, and as 2,500*l.* had been allowed for this purpose in the 11,500*l.* which formed the subject-matter of the inquiry, the Inspector reduced the gross amount by 1,100*l.*, allowing 6,400*l.* for the holder, and suggested that the Board should apply for the 1,100*l.* for certain works which they had contemplated to execute at the gasworks.

IT is reported that Lord Armstrong has purchased the Castle of Bamburgh, Northumberland, in order to restore it for a home for impoverished persons of cultivated tastes, and to endow it to the amount of 20,000*l.*

THE sub-committee of the finance committee of the Liverpool Corporation have presented a further report upon the scheme for the erection of a new hospital, to replace the present Northern Hospital, in connection with the bequest of the late Mr. David Lewis. They recommend the Council to make free grant of the site for the new hospital, and to contribute 15,000*l.* towards the cost.

ANXIETY is felt by the Leicester Corporation waterworks committee at a threatened water famine in consequence of the small rainfall. The reservoirs are 15 feet below the weir, and the deficiency amounts to some 580 million gallons. The

The Best, Cheapest, and Most Effective in the World.

1a CRESCENT, MINORIES, LONDON, E.C.

water-supply for about six months has been cut off every night at eight o'clock, and although a fresh auxiliary supply of 400,000 gallons daily has been introduced, the stock of water is gradually diminishing. Several hundred workmen are now engaged completing pipes and temporary works from the site of a new reservoir which has been commenced, but the supply may have to be further largely reduced.

THE Birmingham City Council intend to borrow a sum not exceeding 34,000*l.* for the purpose of purchasing property in Woodcock Street and Little Ann Street, and for erecting 116 workmen's dwellings on the land so acquired.

THE extension of the Liverpool Electrical Overhead Railway to Seaforth has been inaugurated. The addition has cost 30,000*l.*

THE Fishery Board have agreed to vote a sum of 4,440*l.* towards the construction of a harbour at Collinston, a fishing village in the parish of Slains, and about a mile to the north of the mouth of the Ythan. The harbour is to be erected at a cost of 6,040*l.*, according to a design prepared by Mr. A. Melville, engineer, Aberdeen. The works will be carried out without delay.

THE waterworks committee of the Manchester Corporation have prepared their report for the year ended March 31. In reference to the Thirlmere works, it is expected they will be completed and ready for the delivery of the first instalment of water during the present year. Upwards of nine miles of hydraulic mains have been laid, and arrangements entered into for connections to 150 hoists, presses and other machines on private premises.

It is stated that Her Majesty's Office of Works, in which is vested the control of all the Crown lands abutting on Battersea Park, have entered into arrangements by which the site upon which the Albert Palace now stands, together with the small part of the grounds which has not been appropriated for other objects, will be disposed of for building purposes to a gentleman who has already erected residences in the immediate vicinity.

At the meeting of the Edinburgh Town Council the lord provost's committee reported completion of the negotiations with the North British Railway in regard to the proposed improvement of the Waverley Station and the rebuilding of the North Bridge. Lord Provost Russell said the great object of the Corporation had been to preserve the depth of the valley, while at the same time giving reasonable protection from the

weather to travellers. The railway company was not compelled to go on with these works. They had only got power to do so, and if they did begin they must complete the whole thing within seven years.

THE *Dundee Advertiser* says that while workmen were employed carrying out excavations in connection with projected alterations at Bullionfield, Invergowrie, they came upon a system of wooden piping under one of the oldest buildings. The pipes had been made by boring out the centre of straight trees, the hole being about 5 inches in diameter. The small end of each tree had then been fitted into the thicker end of the next. A length of the piping was cut out by the workmen, who found the wood to be in a good state of preservation. The line of pipes passes in an oblique direction through the present buildings, and seems to have no relation with them.

THE County Council have authorised the expenditure of 41,000*l.* for the improvement of Hanwell Asylum.

NEW CATALOGUES.

Horticultural Buildings.—"Photographs and Details of Horticultural Buildings and Heating Apparatus," by Messrs. Compton & Fawkes, of the Anchor Works, Chelmsford, is the title of a new catalogue published by Mr. B. T. Batsford, of High Holborn. In the preface it is stated that the catalogue contains photographs, sections, and a variety of details of a few of the large number of horticultural buildings which Messrs. Compton & Fawkes have carried out, and also particulars of heating apparatus, boilers, &c.; but they have hundreds of sketches of other buildings designed and executed by them, which they are always prepared to submit, as well as to meet clients in any part of the country, make surveys, give information or suggestions, and provide plans and estimates. Their experience, extending over many years, also enables them to design glasshouses which, while admirably suited to all horticultural requirements and containing the latest and most improved horticultural appliances, shall be in perfect architectural harmony with the adjacent buildings. Some out of many testimonials from clients will be found in the opening pages of the catalogue. About twenty-four excellent photographs are given of glass-houses, pavilions and winter gardens, as executed for various clients. As these have been photographed *in situ*, exteriorly and interiorly, the pictures are no mere bald reproductions, but are seen under actual condi-

VINCENT WORKS, WESTMINSTER, S.W.:

Grand Hotel Buildings, CHARING CROSS, W.C.; 1a Ludgate Hill, ST. PAUL'S, E.C.; 33 Bold Street,
Liverpool; 409 Keizersgracht, AMSTERDAM, &c

tions of use with the complimentary enrichment of their contents of rare plants, palms, flowers, &c. To many that part of the catalogue illustrating the sections of houses and varieties of glass-houses will be of practical value in conjunction with the previous picturesque views, and it is advantageous to see the good and effective buildings that can be had for a minimum of cost. Lesser details, moreover, have not been neglected, for instance, frames, plant protectors, lights, &c., also fittings for conservatories and greenhouses, iron gratings, staging of all kinds, lead glazing, &c. The important item of heating has also received ample attention, working plans of heating apparatus being shown, as well as apparatus, and among these details and illustrations of the patent horizontal tubular boilers, and the "Fawkes" improved slow-combustion apparatus for heating by hot water.

WE have received from Messrs. Hayward Brothers & Eckstein their new "Jhilmil" catalogue, descriptive of metal lath for fireproofing buildings, patented in Great Britain, the United States, Canada, New South Wales, Victoria, &c. A few weeks ago we referred to the merits of this system in a notice of the exhibit of Messrs. Hayward Brothers & Eckstein at the Building Exhibition. It is simply the substitution of iron or steel lathing instead of wood laths, the metalwork being of simple but peculiar design to furnish a perfect key for plaster—practically more than what is usually understood by the term "key," from the thorough incorporation of plaster or cement with the metal lathing into one homogeneous material. As a fire-resisting construction it is evidently more reliable than other heavier and more costly devices employed to render buildings, walls, ceilings, partitions, &c., fire-resisting, and moreover it can be used all over a building for floors, roofs, stairs, besides walls, leaving woodwork only necessary to be used for doors, window-frames, &c. It is about the lightest system of fireproofing that can be adopted, not costly in itself, and still less costly from time saved of labour in executing the job, and is also deserving of use from a sanitary point of view. We recommend our readers to consult the catalogue, as we have barely alluded to its merits and advantages, which are not to be judged of merely from the point of cheapness.

A summarised description of the manufactures of Messrs. Hayward Brothers & Eckstein will also be interesting to many as contained in their latest issued circular, giving information in regard of their variety of reflecting prism lights, &c., safety coal-plates, circular staircases, ventilating appliances, stable fittings, ornamental ironwork, &c. These we do not now

intend to refer to further, but would call attention to Hayward's patent cellar-flaps as one among other excellent specialties. These are glazed cellar-flaps, balanced so that they can be opened and shut gently without the exertion of any strength. A pair of glazed flaps are fitted in a guttered curb frame on three sides with movable bearing bar, for clearance of bulky packages if required. A hole is drilled and tapped in lowest front corner to attach pipe to drain. These flaps are balanced by springs in such a manner as not to reduce the opening through the gutter frame, and each pair of flaps is fitted with one guard bar, and a bolt through which a padlock can be passed. Checkered iron flaps are for use where light is not required; they are fitted in guttered curb frames, and each pair is fitted with guard bar, movable back bar, and bolt through which padlock can be passed.

Hot-water and Steam Heating.—We have received from Messrs. Lumby, Son & Wood, Limited, a catalogue of their wrought, welded and rivetted boilers for hot-water and steam heating. The catalogue is of handy and compact size, but nevertheless numbers nearly one hundred and fifty pages, dedicated to the illustration and description of these specialties, the illustrations amounting to perhaps three times as many as the number of pages. Their patent gold medal "Excelsior" boiler has won medals at every exhibition where shown. The following remarks given by Messrs. Lumby, Son & Wood may be of interest:—The large sale which this boiler has secured, comprising many thousands of boilers of every size, from 24 inches by 18 inches to 72 inches by 60 inches diameter, together with the universal approval wherever used, as shown by the numerous and valuable testimonials furnished by the most competent judges after years of trial, combine to place this boiler in the highest possible position for efficiency and economy both in fuel and amount of attention required. A saving of at least 25 per cent. in fuel alone is secured by the use of this boiler. In the construction of this boiler they believe that they have succeeded in combining all the requisite qualities of a thoroughly perfect boiler. It is made of best wrought-iron plates (5-16ths or 3-4ths or 1-2 inch thick, according to the size of the boiler), strongly and firmly welded together, and tested to a heavy steam or hydraulic pressure before leaving the works. The formation of this boiler is such that it gives the largest possible amount of heating surface, and receives the largest possible amount of the direct action of the fire on every point of its inner surface. It especially receives the most direct and intense radiant heat of

the flame and heated gases upon its internal upper dome, thus greatly increasing and economising the heating power. The heated gases, &c., are compelled to pass through the smoke grating in the upper face of the boiler to pass down the front, under the midfeathers, and up the back of the boiler before they can reach the flue, thus travelling over the entire surface of the boiler, and exhausting all their available heating power before passing into the chimney. By these arrangements the greatest economy of fuel is secured, and it is confidently believed, if careful note of the consumption is observed, these boilers will be found to soon save their cost, as well as materially to decrease the labour required in attention thereto. The feeding-tube is through an aperture in the upper dome of the boiler, thus giving every facility for feeding from the surface, and, being independent of the smoke-flue, none of the usual annoyances from this source can arise. There being a large internal capacity for fuel, it may be left from twelve to twenty-four hours without attention, and the inner surface being smooth and straight, it is free from all liability of the coke lodging and leaving the fire hollow, an evil so frequently complained of in other boilers. The boiler, being circular in shape, will stand three times the pressure of horizontal or square boilers. This boiler is simple in construction, and has no complicated and troublesome flues to get out of order, hence its great durability. To the endless varieties of boilers illustrated we cannot do better than to advise an inspection of the catalogue, which contains incidentally much information in addition to quotations of price.

ART METALWORK.

MR. GEORGE WRAGGE, of Salford, has a reputation for his productions in art metalwork. The engraving is an illustration of the beautiful hammered iron railing for the head offices of the Yorkshire Penny Bank, Leeds (Messrs Perkin & Bulmer, architects), to whose designs this work has been made. In addition to the whole of the other metalwork, casements, door furniture, lightning conductor, &c., are being made by Mr. George Wragge for this building. Mr. George Wragge is also engaged at present in fixing his casements at the Higher Grade College, Huddersfield; Owens College, Manchester; Refuge Assurance Buildings, Manchester; new warehouse, Matthew Street, Liverpool; model cottages, Port Sunlight; Southport Infirmary; Glasgow Eye Infirmary; mansions at Eastbourne;

Kilbirnie, Ayrshire; Limpsfield Grange, Surrey; Oakworth, Yorkshire; Manor House, Ashby Folville, Leicestershire;

SOME OF THE PRINCIPLES OF SANITARY BUILDING.

(Concluded from last week.)

WE have now "carcassed" in our building, but we have still several points for consideration. We must take care to preserve our roofs and walls from the enemies which will be continually attacking them—rain, wind and alternations of temperature, heat and cold. We must provide gullies to carry off surface water, and these, whether of metal, asphalt or other material, must be laid to proper inclinations, and have drips so as to prevent accumulations of water, or to spread the same over in thin layers, and with cesspits to be equal to carry off all the rain which may fall in time of storm; and to resist the action of the wind in blowing under or over the same, lead or cement flashings when metal is employed and filletings when asphalt is used, and these require carefully constructing at outlets. Having constructed our roofs and gutters we require to carry the water away from them and to safely discharge it at the level of the ground surface; this we do with either round or square rain-water pipes of lead, iron or copper manufacture. Care must be taken to avoid light materials for these; some are no thicker than paper, and are eaten through within a year or so after having been fixed. They should have ample heads, and should not be fixed with holdfasts against the walls; but should be disconnected from the same by projecting supports so as to leave a clear space of a few inches between the surface of the brickwork and themselves, and so prevent saturation of the brickwork. It is not wise to joint the pipes with any non-elastic putty, better to leave them with good sockets, so as to allow of contraction and expansion; leaky joints allow of water soaking into the walls, and when once the brickwork is thoroughly wetted it takes some time to dry out again. A word of additional caution—rain-water pipes should never under any circumstances be directly connected with the drainage. The water should be discharged through shoes into glazed earthenware channels, and from thence conducted to trapped gullies, which latter should be carefully jointed into the drainage system.

A smoky chimney is an intolerable nuisance, and produces an insanitary condition of things; care must therefore be taken in the construction of the same; they should be carried well up over roofs and shielded from reflex action of winds by chimney-pots of approved design; their interiors should be

rendered smooth with cow-dung parqueting, not with cement, which scales off under the influence of heat. They should be well built in thick brickwork or cement so as not to be cooled down and the heat which causes their ascensive power to be conducted away; it would be well for these reasons to keep them in the middle of the house if possible, and to cement their exteriors and not put architectural embellishments in such positions as may interfere with the wind getting away or forming eddies round them.

Having formed the shell of our structure we proceed to divide it up into rooms. Any cause which produces discomfort is insanitary in construction. Sound passing from one room to another is an intolerable nuisance, dirt is productive of vermin, an insanitary evil. Our partitions are necessarily somewhat thin. The best materials for their construction are good hard well-burnt stocks, blue, Welsh or Staffordshire bricks or iron uprights filled in each side with expanding metal and plastered over, and, if we can afford it, with slag wool laid in the hollow space. This arrangement prevents sound penetrating and damp arising. The usual practice is to use wood quarterings, sometimes filled in with sawdust; nothing is more insanitary. These partitions contain dust and air (partly stagnant); they are the happy hunting-ground of vermin, they readily allow sound to pass and they are easily burnt away. Partitions and walls should not be finished next floors with wood, but with cement skirtings, the simpler the better; the less resting-places for dust and the intrusion of filth and vermin the more sanitary the house becomes.

The space being divided into rooms, we must now floor and ceil them; we are actuated by the same philosophical considerations in so doing as we have before stated. We want non-absorbent materials, non-conductors; facility for cleansing and keeping clean.

As with partitions, so with floors, the present practice in this country, from a mistaken idea of economy, is to construct our floors with wood joists with wide apertures between them, lath and plastered underneath, and covered above with soft wood boarding having imperfect joints. The thickness of such floors averages about 12 inches. The insanitary consequence of such construction is that dirty air filled with dust and dirt penetrates the plaster, fills the interstices between the joists, rises through the boarding and joints and permits sound to ascend, so that often voices, and even conversation, can be heard with distinctness in the rooms over. Take up a board in the floor of a house which has been built but a

BY HER MAJESTY'S ROYAL LETTERS PATENT.

Established A.D. 1774.
AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above are labelled, either inside or outside with our Trade Mark—The Anchor.

CONTRACTS.

THE LONDON GUARANTEE & ACCIDENT COMPANY (Limited) issue Bonds as security on behalf of Contractors or Builders for the due performance of Government, Municipal, or other Contracts of every description at moderate rates. Office, 61 Moorgate Street, London, E.C.

The Bonds of this Company are accepted by the several Government Departments.

little while, and you will see the dust clinging to plaster and the joists. Plaster allows dirt to filter itself through its substances, and the position of every joist can be discerned from this cause in many ceilings. Add to this that the wind passes with equal readiness, and sometimes with such velocity and force as to raise the carpets. Whilst corridors for beetles, rats and mice are carefully constructed for the incursion and playgrounds of these and similar pests, fire plays easy havoc, I need scarcely add. Putrefying filth fills up the joints formed by the shrunk joints of the boarding. Good sanitary construction would be consulted by the employment for the upper rooms of steel joists, the spaces between being filled in with salt-glazed terra-cotta bricks and coke-breeze concrete, or with some of the numerous patented fittings shown in the exhibition. The floors should be covered with a solid floor, having close joints carried closely up to walls and partitions. The thickness of these floors would average 6 inches, or half of the wood flooring, and it would be well for further prevention of sound if the wood were laid on asphalted felt or on slag wool. A word of caution in using slag wool—it must not be pressed into compact masses. You know as long as wadding is new it keeps the body warm, from its interstices being filled with the air which they contain; compress it and its efficacy departs; so with slag wool. The ceilings will be plastered in the usual manner, preferably with gauged plaster or Keene's cement on Portland cement grounds. The diminished thickness of wall and ceiling will allow a considerable saving in the height and consequent cost of building, so that economy will be really consulted whilst sanitary construction will be insured and danger from fire considerably abated. In the basement, except in sculleries and larders, wood-block flooring laid on bitumen should be used. Tiles and stone, being relatively porous, admit deposits of damp and abstract the heat of the body, whilst solid construction, as suggested, prevents the possibility of ground air or water permeating the house. In more costly-constructed dwellings parquet floorings could with advantage be adopted, and the bad usage of washing floors be abolished, "frottage" or cleaning with paraffin or bees-wax being substituted.

The construction of staircases should be also of concrete, with iron embedded. Stone, besides being cold, is certainly not fire-resisting, and as the object of a staircase is to give easy access to rooms, and egress to street, it ought not to be used in their construction—better to build them of solid wood than of the fragile and easily-combustible materials of which they are

generally formed. Care should be taken that they are well supported with fire-resisting arrangements.

As regards our window-space it should be proportioned to our rooms, and as the retention of light as well as heat is of great importance to the comfort of our homes, enhancing as it does the cheerfulness of our homes, due attention should be given to this detail of sanitary construction. Air in contact with surfaces of glass easily cools; when the walls of our rooms are comparatively warm the glass of the windows is cold, and is often found covered with condensed vapour of the air, and even frozen on its surface. Sir Douglas Galton suggests that adequate light in our climate is not obtained with less than 1 square foot of window surface to about 100 cubic feet of the contents of the room. Light, we know, is considerably modified and affected through the medium in which it passes, and glass is no exception; the thicker it is (if clear) the better. Thin glass is a good conductor of heat. Double windows are of great service, both in retaining heat and preventing sound. The nervous system is much endangered by draught and noise, and when this occurs I consider it is an unsanitary building.

In conclusion, be it remembered, it is not sufficient to simply build well if we place our building in impure surroundings; this will surely negative all our efforts to secure sanitary work. Pure air prevents the decay of organic bodies, and Dr. Angus Smith draws this syllogistic inference therefrom. He says, "If these bodies do not putrefy it is because the air is pure; if pure air does not allow of putrefaction, and if putrefaction is connected with disease, then pure air will prevent all those diseases which are capable of being carried through the means of air." We must, therefore, as far as possible endeavour to secure a sufficiency of air and light around and between our buildings. We must above all avoid overcrowding, either in building or in occupation of the buildings when erected. Overcrowding invariably occasions increased sickness and mortality. Pure air and undimmed sunshine are two of the best prophylactic agents known. Delicate vegetable organisms suffer in proportion to the deterioration of the atmosphere in which they are placed, and you may be quite sure that when this occurs the same deleterious influences are at work affecting your own health, sapping your own energy and laying the foundation for future illness.

Let me caution you as to boiling and filtering your water. A simple filter can be always made with an ordinary flower-pot.

We may not succeed in arriving at perfection; we can do our best to attain it. It has been said that "a little thing"

makes perfection, but that perfection is not a little thing." If I have succeeded in awakening in you an interest in the subject I shall be well contented and amply rewarded. It is a subject which well repays a little time and study, and which, when understood and applied, tends much to insure not alone our own happiness, but that of others who are near and dear to us. I dismiss the subject with the Latin aphorism which runs thus, "Non est vivere sed valere vita" ("Life is not merely to live, but to have good health"), and if you wish this, you must deserve it by making it part and portion of your everyday existence to preserve all your environments sweet, pure and clean, so that the soil on which you rest is undefiled, the air in which you live is unpolluted, the water which you drink is uncontaminated, and the food which sustains you is not only well selected and cooked, but kept from all morbid and improper influences.

CONTRACTING IN GLASGOW.

THE annual general meeting of the Glasgow Master Wrights' Association was recently held, when Mr. Archibald M'Farlane was elected as president, Messrs. A. Forbes and J. Herbertson, vice-presidents, and Mr. J. L. Selkirk, secretary. At the request of the directors, Mr. Wm. Howatt, president of the Institute of Measurers, attended, and delivered an address on measuring, past and present. He referred to some changes affecting the question of measurement which had taken place during the last fifty years in the construction of dwellings. There was now less similarity in the style and detail of work, and more variety in the fittings. Bedrooms were in most tenements made smaller than formerly, but the labour of their construction was the same. A comparison was drawn between the minute detail with which buildings were now measured and the simpler and shorter modes formerly adopted. From examples given it appeared that though the cost of a tenement had only increased 12 per cent. since 1840, the number of items or separate charges in a complete set of schedules had increased by 128 per cent. This great advance in the measurer's work had arisen from several causes. Labour now bore a larger proportion in the cost of a building than it did fifty years ago, and therefore it was expedient that the contractor should have separate and distinct charges for special labour in place of including such labour with the material. The keenness of competition had made it imperative that the party offering should have as much information regarding the

exact nature of the work which he would be required to perform as it was possible to supply. In pricing schedules contractors had now more rates to apply, but there was less calculation necessary to discover the rates. Less was left to hazard, and there was less need of studying plans. It was possible, however, that the elaboration of detail in measuring might have had effects not so beneficial. It had perhaps assisted to increase the keenness of competition, and to cut down prices quite as much as to induce excellence in the work executed. It may also have been instrumental to some extent in putting one contractor upon the same level with another, even although the two might be at the opposite poles as regards experience, capability and commercial position. Mr. Howatt concluded by expressing the hope that the negotiations about to be entered upon by a joint committee of architects, measurers and wrights for the framing of a standard mode of measuring wright-work might speedily be brought to a successful and happy termination.

REGISTRATION OF PLUMBERS.

THE quarterly Court dinner of the Plumbers' Company was held at Fishmongers' Hall, Sir Stuart Knill, master, presiding. Among the company were Sir John Leng, M.P., Sir J. Crichton-Browne, M.D., Mr. W. P. Byles, M.P., Brigade-Surgeon Myers, Mr. Brudenell Carter, Alderman W. Lees McClure, J.P. (Lancashire County Council), Alderman R. Hind, J.P., Colonel Bristow, Dr. E. B. Forman, L.C.C., Dr. J. G. Glover, Dr. Reginald Dudfield, Mr. N. H. Helme (Lancashire County Council), Mr. Philip Wilkinson (renter warden), Mr. Charles Hudson (chairman, Board of Examiners), Mr. A. à Beckett, Mr. S. S. Hellyer and Mr. George Jennings.

The Master, in proposing the loyal toasts, said that on all occasions when health was in question the Queen manifested her interest in the subject. It was to the Prince of Wales specially that the Plumbers' Company owed the spirit with which its members had thrown themselves into the work of registration. His Royal Highness's illness, brought on by bad domestic arrangements and want of scientific knowledge in plumbing, first determined them to devote their efforts to the improvement of sanitation.

Mr. W. H. Bishop, past master, proposed "The Houses of Parliament," and in the course of a few remarks expressed the hope that the Plumbers' Registration Bill would pass into law within a short time.

Sir John Leng, in responding for the Houses of Parliament, said he trusted that all present were supporters of the Bill to which reference had been made that evening. From his position on the opposite side of the House he could bear testimony to the assiduity and the diligence with which Mr. Knowles, into whose charge the measure had been put, attempted to engineer it through the House of Commons. He had not succeeded, however, and few of our amateur legislators, of whom he (Sir J. Leng) was one, did succeed. The fact was that the whole arrangements at Westminster were entirely a work of contrariety. Unfortunately that was a result of our system of party government. He trusted that one of the earliest things which would be done would be to alter the rules of procedure, so that it would be really possible to pass such a measure of great public importance as the Plumbers' Registration Bill.

Mr. Byles, M.P., in proposing the toast of "Municipal and County Authorities," said that his own knowledge of local government was chiefly connected with a large borough corporation in the North of England—the borough of Bradford. He had found there a great community of over 200,000 souls, which was extremely well managed by a voluntary body of its citizens elected from year to year. He had always thought—with the vanity which characterised Northerners—that the people of Bradford were considerably in advance of the benighted citizens of the Metropolis. It might not be un-instructive to show how the matter struck a Northerner. He came to London and he found that much vaunted County Council. After referring to what had principally struck him, he proposed the toast, coupling it with the name of Alderman McClure, of the Lancashire County Council.

Alderman W. L. McClure, in acknowledging the toast on behalf of his fellow representatives of municipal and county bodies, thanked them for the honour they had done them.

The Master, in proposing "The Medical Profession and Sanitary Science," said that one great object which the Plumbers' Company had in view was to prevent the necessity of going to doctors. It seemed therefore rather a contradiction that he should rise to propose the health of the doctors. That, however, he had risen to do, and he could say that that great profession was at one with the Plumbers' Company in endeavouring to dissipate those fumes of typhoid which arose from bad plumbing. Its members were also great assistants in the work which the Plumbers' Company had undertaken. It was therefore with the greatest pleasure that he remained in

Rome to take part in the great Medical Congress which recently met there. The medical profession, especially in England, was one to which all ought to look with the greatest respect. By plumbers particularly were they honoured and respected. It had throughout their work assisted them most thoroughly, and he might say that if it were not for the assistance which, both by word and by deed, they had derived from the medical profession they would scarcely be able to carry out their work. It was, however, sanitary science to which more immediately perhaps they looked in their registration and class work. Their efforts had been directed to giving a certain knowledge of sanitary principles to those who worked in the craft over which they, as a Company of the City of London, had the honour of presiding. It was to sanitary science that they especially looked, and the people generally looked, for protection against the ills of bad drainage and other troubles from which they had been long suffering. He might say that the result, so far as plumbers were concerned—that was to say, the result of the study of theoretical and practical plumbing—was an enormous improvement in the position and the studies of their men. They had endeavoured to establish classes throughout the country for scientific and practical plumbing, and in taking upon themselves that work they had paid their respect and homage to sanitary science. He took it that that great study which they were endeavouring to introduce among their own men was a reverence which they, like all men, delighted to pay to that great science of sanitation. He gave them the toast most heartily and most cordially, and he coupled with it the name of one who from the first had devoted himself to what he knew to be a necessity of the present time—the work which they had specially undertaken. He gave them the name of a gentleman known by all in his profession and in connection with sanitary science, the name of Sir James Crichton-Browne.

Sir J. Crichton-Browne, in replying, said that the labours of the Plumbers' Company had largely conduced to the benefit of the public health. It was dealing with matters which peculiarly appertained to an age in which large towns were extending their arms in all directions like huge octopi, and facilitating more and more the spread of malignant diseases. It was the pride of the medical profession that it was always striving to restrict its field of operations, and in that work it found the Plumbers' Company one of its greatest aids.

The Master, in proposing "Our Guests and those who work with us to promote Technical Education and Sanitation," said

ROLLED IRON AND STEEL GIRDERS.

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4 brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London and Contractor.

JOSEPH WILLIAMSON & CO., MIDLAND FOUNDRY, WELLINGBOROUGH.

MANUFACTURERS OF
Cast-iron Columns, Stanchions, Girders, Window Sashes, Sewer Ironwork, Railway Plant, Ornamental Columns and Brackets for Railway Stations, Cast-iron Tanks, and every description of Castings for the use of Engineers, Builders and Contractors. Estimates gladly furnished on application.

Telegrams:—"IRON, WELLINGBOBO."

that the Plumbers' Company were there themselves as guests in one sense, because they had no hall of their own and were always forced to go to hotels or public places of that kind. They, therefore, had every reason to be grateful to those who allowed them the use of that magnificent hall. He especially owed a debt of gratitude to the Fishmongers' Company. He happened to be alderman of that ward as well as Master of the Plumbers' Company, and he was proud to reckon among his children the Worshipful Company of Fishmongers. Though children, they were perfectly independent of himself, and it was entirely owing to their kindness that the hall was placed at the disposal of his Company. There were present many guests whom it was their delight to honour. In connection with that toast he wished to propose the name of a gentleman who represented there the Prime Warden and Court of the great Company in whose hall they were then assembled—Mr. J. A. Travers.

Mr. J. A. Travers, warden of the Fishmongers' Company, in responding, said that he much regretted that the Prime Warden was unable to be present. He thanked Sir Stuart Knill for the extremely kind manner in which he had referred to the little service the Fishmongers' Company had been able to render his Company, and assured him that all that he had said should be conveyed to the proper quarter. At the same time, he felt that there was a corresponding advantage in having the Plumbers' Company in their hall, in the fact that plumbers would surely not venture to trust themselves in a building which was not in a strictly sanitary condition.

Sir John Leng proposed "The Plumbers' Company." He thought that all would agree with him that the evening would be incomplete if they did not drink in a more special manner to the health of their hosts, the Plumbers' Company having at its head a master who had just filled the highest civic position in the country.

The Master, in acknowledging the toast, said that he hoped as the Master of the Plumbers' Company, to have increasing opportunities of sacrificing himself in the interests of its work.

THE HEALTH OF RANGOON.

EVERYONE who has the welfare of Rangoon at heart will be pleased to learn that so competent an authority as Dr. Grant, the professor of hygiene at the Madras Medical College, prophesies in his recent work on hygiene that Rangoon will take the lead of all Indian cities in healthiness. In his book on "Indian Hygiene" he devotes a considerable space to the importance of proper sewerage systems. Rangoon is the only city in the Indian empire which can boast of a scientific system of drainage which fulfils all the requirements of sanitarians; but in Rangoon, as we all know, this system is only applied in part as yet. The following is Dr. Grant's account of the history of sanitation in Rangoon:—"Previous to 1873 the land was honeycombed with cesspools, and the drinking-water correspondingly polluted. Thereafter the cesspools were closed by order and the night-soil collected by carts and thrown into the river. This horrible system obtained till 1890, when

the Shone system was adopted at a cost of more than 20 lacs of rupees. With thorough conservancy of dry refuse, a good water supply, and efficient subsoil drainage supplementing the effect of such a system of sewage removal, there is little doubt that this great and rapidly increasing city will take the lead in healthiness from her more backward and poverty-stricken Indian neighbours."

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 7496. George Harling, for "Improvements connected with sliding windows or window-sashes."
- 7525. James William Pitt, for "Improvements in chimney cowls."
- 7547. William Bewick Quelch, for "Improvements in sash-windows."
- 7572. Emil Hollandes, Charles James Leather and Carl Bencke, for "An improvement in door-locks."
- 7580. Roger Threlfall, for "A new or improved method of hanging window-sashes, for the purpose of facilitating the removal of same when necessary for cleaning, painting or repairing."
- 7632. George Adams, for "Improvements in sashes and sash-fasteners."
- 7654. Thomas Sherwood Smith and Arthur Harold Smith, for "A cheap and improved method of raising and lowering window-sashes and other objects."
- 7665. Samuel Trueman Potter, for "Improvements in and relating to sash-windows."
- 7732. George Webb, for "An improved method in the construction of revolving-cowls for chimneys."
- 7847. Thomas Powditch Inge, for "Improvements in sash-fasteners."

THE
Architect and Contract Reporter.

**SPECIAL NOTICE TO THE TRADE
AND OTHERS.**

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

No. 208. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

TENDERS.**BALTINGLASS.**

For Works at Parish Church, Baltinglass. Mr. WALTER DOOLIN, M.A., Architect, 20 Ely Place, Dublin. Quantities by Messrs. P. & D. W. MORRIS, Dublin.

At the meeting of the Carnarvon Town Council reports by Mr. Baldwin Latham, C.E., on the water supply and sewerage system of the town were considered, and the sanitary committee's recommendation adopted, that the Local Government Board be appealed to for sanction to loan 3,000*l*. Touching Mr. Latham's report on the discharge of sewage into the old harbour, the sanitary committee reported that in their opinion the engineer's report failed to prove that the present system of sewerage was dangerous to the public health, and in this they were supported by the unanimous opinion of medical men of the town and by the reports of their own officers.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON) — "You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c. — DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

TRADE NOTES.

WE hear that Mr. John Grundy has purchased the whole of the valuable stock and patents of the Helios and Calorifer stoves from Mr. Heim, of Vienna, and Oxford Street, London, W. The premises, 95 and 97 Oxford Street, will be open until June 24, and architects and builders are invited to pay a visit of inspection, as the stock, which is very valuable and purchased for 4,000*l.*, will be sold at greatly reduced prices. We may be sure that Mr. Heim's patents, which have already been so much appreciated, will become even more successful in Mr. John Grundy's hands and under his management.

THE Higher Grade School for Girls, Chester, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

A LARGE clock has just been erected in the parish church, Southmolton, North Devon, at the cost of Mr. A. F. Terrell-Shapland. It shows the time on one 7-inch dial, chimes the Cambridge quarters upon four bells, and strikes the hours. Messrs. John Smith & Sons, Midland Clock Works, Derby, have carried out the work.

WE invite attention to Braby's galvanised iron sanitary manure guards and cages, manufactured by Messrs. Frederick Braby & Co., of Euston Road, which, in accordance with sanitary regulations of the London County Council, have to be used in all stables. It appears that these goods are galvanised after manufacture. They are extra strong, made on strong wrought-iron frames:—Half-round top-rail, 1½ inch by ¾ inch; flat bar at bottom, 1½ inch by ⅜ inch; standards, ½ inch, and covered with corrugated diamond wire lattice, 1½ inch mesh by 10 B.W.G. Others are also made in the same strong manner, and fitted on four cast wheels to suit purposes where something portable is required instead of a fixture.

ELECTRICAL.

AT the quarterly meeting of the Hull Town Council a report was presented by the electric-light committee. The Chairman of the committee stated that they spent 1,631*l.* to produce a return of 2,510*l.*, and after paying all costs of working, there was a balance of 888*l.*, from which 750*l.* went to pay interest, leaving a profit of 138*l.* In the first quarter there were 42 users, in the second 50, in the third 64, and in the fourth 148. They commenced by supplying 3,790 eight candle-power lamps, and ended the financial year with supplying about 9,400. During the 11½ months 74,600 units were used.

THE newly-formed Leeds and County Unionist Club in Park Row, Leeds, has been opened, Messrs. Smith & Tweedale being the architects. The entire building is to be illuminated by electric light, Messrs. Woodhouse & Rawson, of Bradford, having put in the necessary fittings.

AT the meeting of the Iron and Steel Institute, Mr. D. Selby Bigge, in course of a paper on electricity for iron and steel industries, said at present he did not see his way to working blast-furnaces by electricity, but he would seek the aid of blast furnaces in generating electricity, considering that, after a waterfall, a Cleveland furnace was the next best friend to those desirous of generating power economically. There was no difficulty whatever in carrying out the winding, hauling, pumping, drilling, lighting and ventilating of mines electrically.

THE Bury Town Council have approved of plans, &c., for a scheme of electric lighting, and resolved to apply for powers to borrow 25,000*l.* for the purpose.

THE Derby Town Council have decided to hold an electric-light exhibition, commencing on May 14, and Sir Frederick Bramwell has consented to give a lecture in connection with the exhibition in the Guildhall on May 16. The Local Government Board have sanctioned the borrowing of 5,000*l.* for extensions in connection with the electric lighting of the borough.

THE docks and quays committee of the Mersey Docks and Harbour Board recommend the Board to construct a jetty at the south-east side of the Duke Street Bridge, East Float, Birkenhead, and to provide there hydraulic cranes, weighing machines, electric light, &c., at an estimated cost of 7,500*l.*

AT the meeting of the Bath City Council a report was adopted from the municipal buildings committee recommending the acceptance of the tender of Messrs. Wyndham & Waters,

Chicago Exhibition, 1893.

MAW & CO., LIMITED, have obtained Highest Awards for Tiles, Mosaics, and Architectural Faience

of Croydon, for the electric-light wiring in the new building, at a cost of 245*l*, the lowest of six tenders. It was stated that they could make a contract with any company for the electricity.

At the quarterly meeting the York City Council adopted the minutes of the electric-lighting committee, reducing the tenders for consideration at a special meeting to the following:—The Brush Electrical Engineering Company, Limited; the Electrical Construction Company, Limited; Messrs. C. A. Parsons & Co., and Siemens Brothers & Co., Limited.

VARIETIES.

THE dedication of the east window at St. Andrew's Church, Colworth Road, Leytonstone, will take place on Sunday, by the Bishop of St. Albans. It has been erected to the memory of the late Mr. Mark Bean, by his widow. He was interested in every branch of the building trade in the neighbourhood during the whole of his lifetime. The window, which is three lights, is in the style of the thirteenth century, and has been designed and executed entirely in the studios of Messrs. Young & Marten, stained-glass artists, of Stratford, the two side-lights being scenes from the life of St. Andrew in five subjects, and the centre window in three subjects, the Nativity, Crucifixion, and Ascension of Our Lord.

AMONG the unopposed Bills ordered for report in the House of Lords is the Talycafn Bridge Bill. By this Bill a company is formed with a capital of 25,000*l*, for the construction of a stone and iron bridge over the Conway at Talycafn, and road approaches, to take the place of the existing ferry. An arrangement has been made with the Llandudno Commissioners whereby their water-pipes will be carried over the bridge, to obviate the danger to the pipes laid in the bed of the river.

At the meeting of the Rochdale Town Council the minutes of the paving, sewerage and scavenging committee were approved, in favour of erecting more precipitation-tanks at their sewage works at Roach Mills to deal with the whole of the sewage, and to ask the Local Government Board for borrowing powers to the amount of 15,000*l*. for additional lands and works required for sewage disposal.

THE *Leeds Mercury* says:—With a river to be crossed and deep gullies to be spanned, the inhabitants of Newcastle are subject to several portages, or taxes for the repair of bridges. The Byker Bridge, within the city, belongs to a private com-

pany. It is an old brick structure, about the purchase of which by the Corporation there has been years of squabbling. A House of Lords committee recently stopped procedure by the Corporation for leave to rent a railway foot-bridge over the same valley, to give parties an opportunity of coming to terms, the committee stating the figure of 112,000*l*., which the company offered to sell at a few years ago, when 107,800*l*. was the maximum of the Corporation. The bridge originally did not cost more than 90,000*l*. The shareholders of the bridge have now agreed to sell their property at the price named, and the Council have resolved to purchase it.

THE North British Railway Company are to pay to the Edinburgh School Board a sum of 1,500*l*. as wayleave for tunnelling under the High School in connection with their Waverley Station scheme.

At the meeting of the Cheltenham Town Council memorials were received on the Spa revival movement. No definite scheme for a spa was, however, as yet before the Council, though a most favourable report of the quality of the mineral well waters has been received from Professor Thorpe. It was resolved the borough surveyor should submit his present views with regard to the erection of baths and a spa as suggested by the Medical Spa Society at an early date, with an approximate estimate of the expense.

THE Tynwald Court, Douglas, has approved of plans for the erection of a bridge across Douglas harbour, at a cost not exceeding 16,500*l*.

THE York City Council have authorised the estates committee, in view of the freeing of Lendal Bridge from toll in August next, to engage the services of Mr. Max Am Ende, Westminster, engineer and specialist in iron structure, to make an examination of the bridge and report thereon.

At Sutton Coldfield an inquiry has been held inquiring into the application of the Corporation for sanction to borrow 3,500*l*. for works of sewerage and 1,000*l*. for the provision of a depot.

A LOCAL GOVERNMENT BOARD inquiry has been held at Salford with reference to a proposed loan of 14,000*l*. for purposes of sewage disposal (including the provision of a steamship for the removal of sludge to sea) and 10,230*l*. for street improvements.

A TEXTILE hall, which has been built by three of the local trade unions interested in the textile industries, has been opened at Bury.

JAMES HILL & CO., 100^A Queen Victoria Street, London, E.C.

THE *Birmingham Post* says:—The scheme for converting Birmingham into an inland port like Manchester is being pushed forward with increased vigour now that the Manchester Ship Canal is an accomplished fact. The Severn Commissioners have practically completed the dredging of the river and constructed suitable docks at Worcester, enabling vessels of 400 tons burden to come direct from Bristol to Worcester without breaking bulk, and a number of Midland capitalists, including the spirited Earl of Dudley, have inaugurated a project for converting the Birmingham and Worcester Canal into a ship canal, allowing steam vessels 135 feet in length, 21 feet in beam and 8½ feet in draught to come to the Midland metropolis. The engineering difficulties are somewhat complicated, as they involve the raising of the tunnels in the neighbourhood of Birmingham and replacing the existing locks with an inclined waterway. The estimated cost is 600,000*l*.

THE *Carlisle Journal* says:—Another furnace has been lighted by Messrs. Charles Cammell & Co. at Workington. Out of five furnaces built four are now in blast. About 100 additional men will be employed.

THE Cleethorpes Local Board are about to expend 4,500*l*. upon new drainage works, and an inquiry into the matter has just been held by Mr. Arnold Taylor, Local Government Board inspector.

LONDONERS who cannot escape to the country next week may find some compensation at the Aquarium, where at intervals of about five minutes new performances can be seen. Daily there will be over ninety "turns," and monotony will be avoided.

THE construction by the Bute Dock Company of a new dock and works at Cardiff, which will involve an expenditure of 750,000*l*., has just been sanctioned by a committee of the House of Lords.

THE Local Government Board have given sanction to the Rawdon Local Board to borrow 4,446*l*. for land on which to erect sewage purification works, and 11,000*l*. for the intended sewerage of the township.

AT the meeting of West Sussex County Council at Horsham it was reported that the further plans prepared by Sir Arthur Blomfield relating to the reduced lunatic asylum, having accommodation for 450 patients, with administrative capacity for 600, had been considered by the committee, and were recommended for approval by the Council. As regards the cost of the buildings, it was impossible to say what it would

be until the quantities were taken out and tenders obtained from contractors. So soon, however, as the complete drawings were ready, the surveyors appointed to take out the quantities would at once begin their work. Approximately, the committee put the total cost at 153,797*l*. 6*s*. 2*d*.

PUMPING BY OIL ENGINES.

OIL engines are gradually coming into use for pumping purposes in country mansions and large establishments where steam-power is not provided, and Messrs. Merryweather & Sons have recently constructed a pump of new design, driven by a small oil engine, for a gentleman's house in Canada. This pump is built on the lines of the firm's small steam fire-engines, being entirely of gunmetal, with valves of the London Fire Brigade pattern, and is fixed in an A frame. The oil engine is of the vertical type, and runs at high speed, driving the pump by means of a belt and pulley direct. A friction clutch is fitted to the pump pulley, so that the pump can be stopped and started without stopping the engine. The quantity of water delivered is 2,000 to 3,000 gallons per hour, so that an hour's pumping per day will provide a plentiful supply for most mansions at a far less cost for fuel and attendance than that of a small steam or gas engine. The average cost per brake horse-power for the oil fuel used is about sixpence per ten hours pumping. Such an engine does not require heavy foundations, a few baulks of timber bolted together being amply sufficient, while the cost compares favourably with other systems.

ST. BARTHOLOMEW'S, SMITHFIELD.

A MEETING of the restoration committee of the Norman church of St. Bartholomew-the-Great, West Smithfield, was held on the 3rd inst. to consider the critical condition of the lady chapel buildings and of the fifteenth-century crypt beneath. The effort made last year left the committee with only 800*l*. towards completing the work, which will cost about 3,500*l*. The committee decided that the remains of the fifteenth-century work are so valuable that they must make sure of preserving what they can with the money in hand, and with that object they propose to begin at once on the westward bay of the chapel. The crypt is under the eastern portion,

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London and Contractor.

and the restoration of this is most urgently called for by the need in the neighbourhood for a mortuary chapel, to which purpose it is proposed to place the crypt when restored. The work of last year in the transept seems to have given universal satisfaction. It has already toned down wonderfully with the new work. The committee have therefore decided to appeal for further funds at once, in hope that sufficient help may be given to warrant their progressing with this work at the same time.

IMPROVEMENT OF THE SEVERN.

THE Gloucester Corporation Bill, which seeks power to obtain an additional water supply, has been considered by the police and sanitary regulation committee of the House of Commons, Mr. Kenrick presiding.

Mr. Martin, engineer to the Severn Commissioners, said the Westgate Bridge was a stone arch with a span of 88 feet, but it had a headway only of 78 feet at low summer level, and that headway was only obtained in the centre of the bridge, which sloped rapidly on either side, so that at the side of the river there was only a headway of 5 feet. In addition to being awkwardly constructed, the bridge was approached by almost the most difficult bend of the river, which was very much narrower there than it was higher up, where it joined the western channel, and where the waters discharged into the Channel. The course of the river was extremely winding at this bridge. In times of flood and tides the headway was considerably decreased, with the effect that the vessels he had described—vessels which stood 14 feet out of the water—were blocked for sixty days per annum. The *Emilie*, of Cardiff, a type of vessel well suited to the trade of the river, had been unable to get under the bridge. There was a strongly expressed desire in Cardiff, Worcester, and, he believed, Birmingham, for the removal of the Westgate Bridge, so as to improve the navigation. The Gloucester Corporation were opposed to the conversion of the bridge into an opening bridge. There would be no appreciable engineering difficulty in carrying the water main under the river instead of across the bridge. He estimated that under the most favourable circumstances the extra cost would be about 750*l.*, and then something would have to be added for contingencies. The work would certainly not cost 2,000*l.* or 3,000*l.*, as estimated by the engineer of the Gloucester Corporation. In cross-examination, the witness

said the cost of tunnelling under the bridge for a 14-inch main would be about 750*l.*, but it would be impossible to give an accurate estimate, as tunnelling under a river was a risky thing. He did not think a tunnel was absolutely necessary, but he thought it was probable. That was the principal way in which the *status quo* would be effected. Re-examined: His father estimated that to make the bridge swing would necessitate the expenditure of 11,000*l.* odd. By the Chairman: The Severn Commissioners had a scheme before them for the improvement of the bridge, but at present they had no funds with which to carry out the work. It was not likely the improvement would be long postponed, as there was considerable feeling, and it was very probable that the funds would be raised and the Commissioners requested to do the work. There was not a great deal of traffic over Westgate Bridge, and therefore not much inconvenience would result if the bridge were made to swing.

Mr. Leader Williams, chief engineer to the Manchester Ship Canal, said he had a great acquaintance with the Severn. There was now a 10 feet navigation, and the only obstacle to getting larger vessels up the river was the existence of Westgate Bridge. The Severn Navigation had been of great value in keeping down the railway rates from Cardiff to Birmingham and the Midland districts. In cross-examination by Mr. G. B. R. Fitzgerald, and in reply to the Chairman, witness said he had a distinct preference for the tunnel under the bridge. As an engineer, independent of cost and other circumstances, he would rather carry the main under the river than over the bridge. A swing-bridge would accommodate vessels which would require from 20 to 25 feet. He thought the Gloucester Corporation should pay for the improvement of the bridge.

Captain Pomeroy, dock master at the Bute Docks, Cardiff, said the Cardiff Chamber of Commerce had discussed and passed resolutions in favour of the improvement of the navigation of the river Severn. This great waterway was, to everybody's regret, simply destitute of traffic. His company had subscribed 3,000*l.* towards improving the navigation, and he had been sent on a tour of inspection, and what he had seen had simply astounded him. The principal obstacle to the navigation of the river was the Westgate Bridge, which in the interest of navigation should be constructed into a swing-bridge.

Mr. Thomas Thompson, a director of the Barry Dock and Railway Company, said the Bill very seriously interested his company, and he had been deputed to give evidence against it.

The committee, after a few minutes' consultation in private,

passed the Bill, but laid it down that the pipes over the West-gate Bridge should be laid down in such a way as not to interfere with the navigation of the river. Any alterations to the bridge should be made at the expense of the Severn Commissioners if they desired to make any alteration.

GRIMSBY DOCK EXTENSIONS.

AMONG the extensions of the Grimsby Fish Docks, to be carried out by the Manchester, Sheffield and Lincolnshire Railway Company, will be the construction of an entirely new approach to these docks, which will open out a large amount of building land. The present route to the fish market will be entirely abolished, and a handsome thoroughfare, 50 feet in width, will lead direct to the fish pontoon and docks from Riby Square, forming practically a continuation of Freeman Street, now the principal street in the town. The new dock works proper include an additional lockpit at the fish docks (there are already two), with piers, and a "gridiron" for repairs; new dock basin, the enlargement of No. 1 fish dock, the enlargement of No. 2 fish dock to over double its present size, the erection of two new coal-drops, the building of stone quays, and the extension of the fish pontoon. It is estimated that the total works will triple both the quay space and fish market accommodation, and will cost nearly a quarter of a million of money.

SHREWSBURY ABBEY CHURCH.

A FURTHER considerable stage towards the complete restoration of the fine old abbey church at Shrewsbury has just been reached by the addition of a new nave roof and clerestory. The work, which has been carried out as the gift of an anonymous donor, has been under the direction of Mr. J. L. Pearson, R.A., from whose plans the new chancel was built in 1887. The nave, originally a fine structure of twelfth-century date, had during a long course of years undergone many transformations. The aisle-roofs had been so far lowered as to leave the bold Norman arches of the triforium exposed externally. These arches had been walled up and windows of poor character inserted, the ancient nave-roof had wholly disappeared, and

consequently these inserted windows were needed for light. The ancient clerestory had now been rebuilt, and a new oak roof of high pitch put on the nave to continue on the high-pitched roofs of the restored choir and transepts.

NULLIFYING AGREEMENTS.

THE case *Gibb & Co. v. Vivian* occupied the attention of the official referee, Mr. Ridley, Q.C., the greater portion of last week. The action was taken to recover a balance of 900*l.* for work done at No. 24 Eaton Square, Belgravia. The plaintiffs, who are builders, of West India Dock Road, E., entered into a contract to make various additions and alterations to the above house for 1,100*l.*, and the action was to recover for extra work beyond that amount. Mr. John A. Gill Knight, architect, who measured and valued the extra work, was called on behalf of the plaintiffs, and Mr. Humphries Davies acted as surveyor for the defendant. The case turned principally upon the validity of the original contract, and in the end the referee entered judgment for the plaintiffs for 1,850*l.* and costs, being 75*o*l. beyond the contract sum, holding that the parties had by their subsequent action rendered the agreement entered into null and void.

BUILDING IN JERUSALEM.

ACCORDING to report of the British Consul at Jerusalem, buildings of various kinds continue to be erected in the vicinity of Jerusalem, and the city is fast outgrowing its former limits. On the western side houses have increased so rapidly within the last few years that quite a large suburb has arisen where formerly fields and vineyards existed. Every available piece of land is now being bought up by private persons or by benevolent societies and missions, and already the name of "Modern Jerusalem" has been given to this new quarter. The latest enterprise suggested is the placing of a steam launch and lighters on the Dead Sea. If this were done, the produce of Moab, which is a country rich in cereals, fruit and cattle, could then be ferried across in a few hours in the lighters in tow of the steam launch, instead of having to be conveyed by caravans round the north or south end of the Dead Sea, entailing a journey of from four to five days.

THE IRWELL AT SALFORD.

A MEETING of the Mersey and Irwell joint committee was held in Manchester on Monday, when it was resolved to prosecute the Salford Corporation for pollution of the river. At the meeting the following statement by Sir Henry Roscoe was read:—

At the last meeting of the joint committee, held on April 2, a report was presented by me on eighteen samples of sewage effluents, two of which came from Salford and were of a very noxious character, and the analytical results placed them at the bottom of the list which you will find in the printed proceedings of the committee. Alderman Walmsley is reported in the daily press as having taken objection to the results and challenged their authenticity, and further stated that he was not at all satisfied with the way in which a good many of the proceedings were carried on. I wish, first, to make a few remarks on the strictures which have been published in the press by Mr. Carter Bell, the analyst to the borough of Salford. In a letter to the newspapers of April 3, 1894, Mr. Bell impugned the accuracy of the above analyses of the Salford effluent, and made statements which will not bear chemical criticism. Mr. Carter Bell, whilst finding fault with my analyses, violates in his own words "the very rudiments of analytical chemistry," for he makes the statement that "every tyro in the science is aware that the application of the acid permanganate test to a water containing salts of iron is utterly fallacious." He knows perfectly well that it is only when the iron is in the ferrous state that this objection applies; he also knows that the salts of iron which were employed for some time previous to the date of his letter, and on the dates when the samples were collected, were not ferrous but ferric salts. These facts are sufficient to condemn the line of argument which Mr. Bell has thought fit to take. As a matter of fact, I did ascertain before applying the oxygen test whether or not ferrous iron was present, and in every case I found none. Mr. Bell further stated that "the amount of oxygen absorbed from an acid solution of potassium permanganate in the case of the clear chalybeate stream which runs through Buxton would be much greater than the amount absorbed under like conditions by the Salford effluent." This statement is incorrect, for, as Mr. Bell knows, the amount of iron in the ferrous state which must be present in the chalybeate water of Buxton in order to give the same results as the Salford effluent would be 33 grains of ferrous oxide per gallon, whereas

a sample of the Buxton stream collected by the deputy-clerk a few days ago was found to absorb less than one-tenth grain of oxygen from an acid solution of potassium permanganate per gallon. In order to show the fallacy of Mr. Bell's arguments I will suppose that the Salford effluent contained 11 grains of ferrous oxide per gallon—a plainly absurd amount. The quantity of oxygen required to peroxidise the iron is 1.2 grain, and this deducted from the Salford effluent figure, viz. 3.02, would still leave the Salford effluent at the bottom of the list. It is interesting to find that whilst Mr. Bell objects to the acid permanganate test for the Salford effluent in this particular case, he has invariably made use of it himself in his printed reports to the Salford Corporation. In a second letter (April 10) Mr. Bell endeavours to substantiate his opinion by a reference to a report on the Barry process experimented upon by the Corporation of Salford in the year 1891. Without discussing the conclusions arrived at in that report, I may point out that I fail to see how a reference to a process tried and condemned in 1891 can affect the examination of the effluent in 1894, when this process was not in use, but a totally different one was employed. But whilst challenging Mr. Bell's criticism as to the value of the permanganate test, I have always made it a point when action had to be taken by the committee to have this test strengthened by other analytical data. No case has ever been brought by me before the courts without a statement of a complete analytical character, and in no case have the results obtained from such further analytical data failed to support the results of the permanganate test. The question for the consideration of the committee is, however, too plain to rest upon chemical subtleties. All the Salford effluents collected in March and April after standing for a comparatively short time are found to be putrescent, noxious and polluting liquids, unfit to be discharged into any river. At the last meeting the opinion was expressed that my more frequent presence at the committee meetings was desirable. I can only say that I have always wished to be present when the committee thought it necessary, and it will be my pleasure in future to attend whenever I am summoned. With regard to Mr. Scudder, I think it only right to say that he has during the last twelve months spent 186 working days in the service of the joint committee, that he has attended 10 legal cases, all of which have been gained. He has visited 77 works, analysed 150 samples and presented 122 reports to the joint committee. It is no more than my duty to express my satisfaction to the committee that we have in

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING any proposed or existing building. All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Wetzel's Patent). Besides this it facilitates distribution of effect, and is extremely economical in working. HEAD OFFICE:—

Mr. Scudder a reliable and energetic chemist. With regard to the position of manufacturers, I cannot refrain from stating that the satisfactory results, as shown by the tables prepared by Mr. Tatton, could not have been arrived at had it not been that the demand of the joint committee had been met in a conciliatory and even generous spirit by the manufacturers, who, as a rule, have at once adopted any suggestions I have been able to make. The work of the next twelve months will not only include the continuation of that which we are engaged upon, but also the careful examination of the results of the processes adopted by the various trades on the stream, and I am glad to be able to report that, so far as we can now judge, considerable improvement has already been effected in trade effluents. I hope in a future report to enter into full details of this matter.

METRIC SYSTEMS.

At the meeting of the Leeds Association of Engineers, Mr. Thornton, president, in the chair, a paper was read by Mr. F. Howard Livens, of Lincoln, on "The British and Metric Systems for Engineers' Work." More calculations, he said, were made in weights and measures in engineering than in any other trade or profession. Engineers were therefore particularly interested in having that system of weighing, measuring and calculating that would give both accurate and rough results with the least labour. Referring to the evolution of standards, he said that the British system was consolidated about 1758. Our system, however, was only convenient within narrow limits. With regard to a further reconstruction of it, the proposed inch, pound and gallon basis did not leave three measures untouched, and would entail as much trouble as the metric system, without its advantages. A careful investigation showed how admirably the metric compromised between conflicting interests. The mètre as a unit might be considered long, as compared with our foot, but the centimètre was most suitable for general engineers' dimensions, whilst there was no comparison between reckoning in millimètres against 16ths and 32nds of an inch. The system afforded the most simple relations between the units of length, weight and capacity; and the identity for practical purposes of the litre and cubic decimètre and of their volume in water with the kilogramme, was of special advantage for engineers' computations. Mr. Livens further showed how the rule could be partially divided so as to combine minuteness with clearness. This system had

already obtained a footing in England, and he quoted a report from Messrs. Willans & Robinson to the effect that the change caused no difficulty, that there were no errors, and that it gave the workman a clear idea of proportion. Mr. Livens gave a number of parallel examples of calculations and estimates worked out on the British and metric systems, showing great saving in labour by the use of the latter. For scientific purposes the metric system, he submitted, was a necessity; business would be expedited by its adoption, and the cost to manufacturers would be recouped.

THE ROYAL DUBLIN SOCIETY THEATRE.

In the House of Commons on the 3rd inst., Mr. William Kenny asked the Secretary to the Treasury what was the cause of the delay in commencing the works for the construction of the new lecture theatre of the Royal Dublin Society in Dublin, to which the Society has subscribed 5,000l.; would he explain why, although plans were approved of in November 1892, tenders were not invited by the Board of Works until December, 1893; if he was aware that tenders were sent in last January, and that no apparent action had been taken with reference to them since that time; and if he would take steps with a view to having the works at once commenced, and the contract with the Society, on the faith of which they subscribed the 5,000l., carried out?

Sir J. Hibbert in reply said the plans approved of in November 1892, were only preliminary or sketch plans without any details agreed upon between the Royal Dublin Society and the Board of Works, and the delay as soon as the revised plans were ready (in April 1893) has been due chiefly to the fact that the estimate of cost largely exceeded the sum authorised by the Treasury, and it was therefore necessary to make arrangements for the purpose of avoiding such excess. It has been within the knowledge of the Society ever since January that the Board of Works have been in communication with the architects and the surveyor with that object. The contract for the theatre is now ready for signature, and is only delayed by a demand by the Society for inclusion in the scheme of two rooms having no connection with the purpose of the theatre. The Board of Works have informed the Society of the impossibility of proceeding with the work on the understanding that these rooms are to be provided, and as soon as the Society assent to their omission the contract will be signed by the Board of Works forthwith.

and brackets.

JOSEPH GILLOTT & SONS, Birmingham—Pens.

GODWIN & HEWITT, Hereford—Tiles.

RICHARD HORNSBY & SONS, Limited, Grantham—Steam
pneumatic rock drill.

JEFFREY & CO., London—Artistic wall-paper, embossed
leather, leather-paper.

CHARLES KNOWLES & CO., London—Art wall-papers.

MACFARLANE, STRANG & CO., Limited, Glasgow—Cast-iron
water-pipe, straightway or gate valves, water-meter, water
filters.

MAW & CO., Limited, Jackfield, Shropshire—Tiles, mosaics,
architectural faience pottery.

JOHN SMITH & SONS, Derby—Bells, chimes, clocks.

JAMES STOTT & CO., Oldham—Gas-burner and governors.

TILGHMAN'S PATENT SAND BLAST CO., Limited, Sheffield—
Patent sand blast apparatus.

THE TUBULAR LOCK SYNDICATE, Limited, London—Patent
tubular reversible noiseless locks.

WINFIELDS, Limited, Birmingham—Stained-glass. Ditto—
Brass bedsteads, brass lectern.

WILLIAM WOOLLAMS & CO., London—Wall-paper. Ditto—
Leather wall decorations.

C. H. WORSNOP, Halifax—Lamps.

SOCIETY OF ENGINEERS.

AT a meeting of the Society of Engineers, held at the Town
Hall, Westminster, on Monday evening, May 7, 1894, Mr.
George A. Goodwin, president, in the chair, a paper was read
by Mr. R. Nelson Boyd on "A Deep Boring near Freistadt,
Austria, by the Canadian System."

Before entering on a detailed description of the boring opera-
tions under consideration, the author described the early
methods of boring for minerals. He then explained the differ-
ent systems of boring adopted, commencing with the early
improvements introduced in Germany, alluding specially to the
"free-fall" as compared with the "jars" as used to produce
the effect of the cutting tool in the bore-hole.

The author then described more minutely the American
rope system and the Canadian, in which ash poles or rods are
used. The tools were explained, and the construction and
working of the so-called rig fully illustrated. After a somewhat
detailed description of the machinery adopted at the deep
boring, the author proceeded to state that this work was under-
taken for the purpose of proving an unknown portion of the
Ostrau-Karwin coal-fields in Austria, which is a continuation of
the Prussian Silesian coal-field. This part of the coal-field is
covered by a tertiary deposit of clay, which the local geologists
assimilate to the Vienna basin, and which varies in thickness
from a few feet to several hundred yards. The object of the
bore-hole was to penetrate through this deposit of clay and
discover the coal-measures.

A bore-hole had already been put down in the neighbour-
hood to a depth of 710 feet into the clay without passing
through it, and therefore the proposed boring was expected to
be one of considerable depth. The diamond drill was first
selected, but could not be applied owing to an insufficiency of
water, and eventually the Canadian rig was adopted. The
author then proceeded to describe the process of boring, the
difficulties which had to be overcome, and the manner of lining
the bore-hole. In the course of the sinking a spring of water,
charged with bromide and iodide salts, was cut at a depth of
1,010 feet. Inflammable gas was first observed at a depth of

NOTICE.

Mr. JOHN GRUNDY has purchased the whole of the Valuable
Stock and Patents of The Helios and Calorifer Stoves from Mr. H.
HEIM, of Vienna and Oxford Street, London, W.

The Premises 95 and 97 Oxford Street will be open until
June 24, and Architects and Builders are invited to call, as the stock,
which is a very valuable one, will be sold at greatly reduced rates.

HEATING APPARATUS.

SUCCESS GUARANTEED. GRUNDY'S SPECIALTY. PURE WARM AIR.

UPWARDS OF 1,000 TESTIMONIALS RECEIVED FOR

GRUNDY'S PATENT APPARATUS

For Heating all kinds of Buildings with External Air, Warmed by his System.

Recommended by many of the most eminent Architects throughout the United Kingdom.

EVERY KIND OF HEATING APPLIANCE

Manufactured at Grundy's Foundry, Tyldesley, near Manchester. All kinds of

Stoves and Fire Grates, and every kind of Hot Water Heaters.

Combination of Pure Warm Air and Hot Water as applied to Truro Cathedral, Londonderry Cathedral, Cardiff New Catholic Cathedral,
Kilmore Cathedral, Sherborne Abbey, Wandsworth and Clapham Workhouse, Queen School Chapel, Eton; Corpus Christi College,
Oxford, &c., &c. Book of Testimonials forwarded Gratis on application to

JOHN GRUNDY,

Warm-air Consulting Engineer, 30 DUNCAN TERRACE, CITY ROAD, LONDON.

N.B.—Perfect Success Guaranteed or No Pay.

960 feet, and when the boring was not going on the noise of the bubbling gas in the bore-hole was like the boiling of a gigantic chaldron.

The boring was continued down to a depth of 2,011 feet 6 inches without passing through the clay deposit. It was accomplished in one year five months five days. The actual drilling averaged 10 feet 6 inches in twenty-four hours' work.

In conclusion the author observed that the Canadian system has many advantages. In drilling through highly inclined measures it is preferable to the rope system, and by the use of the jars a much greater rapidity of drilling is attained than with the free-fall method.

THE BETTERMENT PRINCIPLE.

THE principle of "betterment" came before the select committee of the House of Commons in the course of the evidence on the Tower Bridge (Southern Approach) Bill. Mr. Field, surveyor, who gave evidence in support of the Bill, in the course of cross-examination admitted that under the Bill the betterment charge would be placed upon empty houses and vacant land, but he could not see why it should not. The charge would be put upon them, but no rates would be levied upon them. The betterment charge was not, in his opinion, a rate, and it would be payable on vacant land just as the land tax was payable now. Assuming the betterment charge to be a rate, he admitted that to rate empty houses and vacant land was a departure from the basis of rating hitherto adopted—that was to say, profitable occupation. There would be no difficulty in estimating the amount of betterment in the case of empty houses or vacant land. A piece of land, at present fit only for the erection of a couple of cottages, might, if a great thoroughfare were constructed in front of it, become suitable for the erection of a factory. The value of the land would rise automatically. He thought the works might be completed in twelve months.

Mr. Robert Vigers, surveyor, who gave evidence for the opponents, said he had for forty years been employed in compensation cases, having acted as surveyor and valuer and as arbitrator and umpire. In his opinion the betterment clause would be at variance with the general system of taxation in this country, and would prove to be very arbitrary and inequitable. The charge for betterment must have some relation to the value of the property. A surveyor must have regard to the value of the property before and after improvement; better-

ment must increase the rental value. In his opinion it would be very difficult for an arbitrator or valuer to calculate the enhanced value likely to be derived from new streets. It would be very speculative indeed; a new street took some years to develop, and it would be almost impossible for any surveyor to say what was going to be the effect of a new street. The new bridge would take away some of the traffic from London Bridge, and if the property between London Bridge and the Tower Bridge had been subject to a betterment charge that charge would be left, although the traffic had been taken away. Many properties would not be benefited by this improvement; indeed, in the case of small traders, damage would be done, and the small trader would have no claim to compensation because his trade had been destroyed by the improvement. If a man's property was improved he would have to pay increased rates, and to put a betterment charge upon him would be to tax him twice over for the same improvement. Again, the ratepayers of Bermondsey had contributed for years towards improvements in other parts of London, from which they had received no benefit whatever, and it was only fair that the ratepayers of other places in London should contribute towards the improvement of Bermondsey. Besides, the system of rating had the advantage that if the property decreased in value the rates fell too.

Mr. T. W. Hewson, surveyor, said in his opinion the application of the principle of betterment was impracticable. Under the existing rating law property paid fairly for the cost of improvements. The great difficulty under the system of betterment would be to ascertain the proportion of value that accrued from the new street, as distinguished from the proportion that accrued from natural causes in the locality or, in this case, from the bridge itself. If the principle was adopted all dealing with the property affected would be suspended. It often happened that the formation of a new street greatly damaged the properties in the side streets. He looked upon this as an essential metropolitan improvement which ought to be paid for by the whole community. He thought the principle of recoupment was preferable to that of betterment. The main difficulty with regard to recoupment was the expense of buying out existing trades and businesses. The fact that in no case has any substantial sum been recovered under the system of recoupment simply shows that no betterment has taken place. But if no betterment takes place the objection to the system falls to the ground. There will be improvement, but it is impossible for any living man to define

the amount of betterment produced by the new street. In a great town there is a multiplicity of circumstances contributing to the improvement of a property, and it is impossible to separate one from the rest.

THE LONDON STREETS AND BUILDINGS BILL.

THE important Bill for the consolidation and amendment of the Metropolitan Building Acts, promoted by the London County Council, has been assigned to the consideration of a select committee of the House of Commons, with Mr. Stuart Wortley as chairman.

In addressing the committee for the promoters Mr. Cripps, Q.C., said that the amending part of the Bill was based upon two reasons—either that modern requirements on sanitary grounds were in advance of what was found to be sufficient under the old Acts, or that the bodies that had to carry them out had found certain faults with the principle of those Acts. It was in that respect that the Council asked for amendments. As regarded consolidation, there was no real conflict between promoters and opponents. Passing on to explain the provisions of the Bill which introduced any change in principle, counsel said that the first part had to do with the formation and widening of streets, and, apart from consolidation, there were only three new points which arose upon it. The first point was that the Council desired that notice should be given before streets were laid out or formed. It was most important that the Council should have notice before any works had been begun or expense incurred. Another new point was with reference to the width of streets. At present the minimum width at which a street intended for carriage traffic could be laid out was 40 feet. The proposal in the Bill was that in certain cases the Council might require a width of 60 feet. Another proposal was that with regard to streets not within a distance of two miles from St. Paul's they might require a building to be set back 5 feet from the street in the case of a street to be formed after the passing of the Act. A new street, however, did not necessarily mean a street in a newly laid-out building plot. A street might be altered to such an extent as to become in substance a new street. It was not proposed to pay any compensation in this case. On Part II. of the Bill, which dealt with the question of the lines of building frontage, he was not aware that any question of principle would arise, except perhaps with reference to the concurrent jurisdiction now exercised by the vestry and the

County Council. The question did arise whether, as the Bill stood, the jurisdiction was left in the hands of the Council alone. The Council asked for exclusive jurisdiction. Steps had to be taken in these matters within six months, and if there was concurrent jurisdiction and the local authority took proceedings and subsequently dropped them, the Council would be out of time in all probability. It was proposed that appeals under the Act should go to a tribunal consisting of five instead of three members, as under the Act of 1890, one of whom was to be appointed by the Council. Part III. of the Bill dealt with the naming and numbering of streets, and he did not think any questions would arise upon that. Part IV. was introduced entirely for sanitary and health reasons. In the Act of 1890 there were provisions with regard to unhealthy houses and what were called obstrusive buildings. While they were destroying unhealthy areas in one part of London, such areas might be created in another part. The result of these provisions would be to prevent the creation of unhealthy areas or buildings in the future. In substance they asked, in this part of the Bill, that greater space should be allowed round buildings in future, and that there should be better protection in regard to light and air. These provisions were limited to a certain class of domestic dwellings, having an area of less than 100 square feet, and to dwellings constructed for the accommodation of more than two families. There were also in the Bill provisions dealing with the question of the height of buildings. Under the Act of 1890 the limit was put at 90 feet. This Bill proposed 75 feet as the limit. It was on this part of the Bill that there was most opposition. The question was whether the provisions were too stringent or not. The Council had adopted this part of the Bill as containing what they considered to be the minimum requirements. In another part of the Bill it was proposed that all questions arising under it should be assigned to a particular magistrate, as it was most desirable in order to obtain uniformity. Section 150 set out the constitution of the tribunal of appeal. One member must be appointed by the Secretary of State, one by the Council of the Institute of British Architects, one by the Council of the Institution of Civil Engineers, one by the Surveyors' Institution, and one by the County Council; but no member or officer of the Council was to be appointed. It would thus be seen that all matters under the Bill were to be left to an entirely independent authority—a provision which he thought strengthened the case of the County Council very

much. Counsel referred to the petitions against the bill, and suggested that the same procedure should be adopted as was adopted in the case of the railway rates inquiry and the Thames Conservancy Bill, namely, that before a convenient time, to be named, the opponents should tabulate the amendments they wished to introduce, in order that the County Council might know what they wanted, and in order that the points at issue might be ascertained.

Mr. Littler, Q.C., speaking for associated owners, objected very strongly to this course being taken. The Bill was of such a sweeping character that the amendments he should propose would amount practically to striking out all the new provisions, which were entirely destructive of the interests of his clients.

Counsel for other opponents having expressed themselves to the same effect, the room was cleared for consultation.

The Chairman announced that the committee had decided that it was safer to pursue the ordinary procedure, and discuss the preamble first. In the first instance, it would be convenient to all parties that the evidence should be directed to establishing the preamble, as far as it related to Part I.

THE BLACKWALL TUNNEL.

HITHERTO the work of excavating and constructing the Blackwall tunnel has been carried on without the safeguard of compressed air, the adoption of which has from the outset been arranged for. According to the *Daily News*, the contractors, Messrs. Pearson & Son, of Victoria Street, are, however, of opinion that they have gone as far as it is safe or practicable to go with ordinary pumping in the tunnel itself, and that to attempt to go further would be to incur great risk of a serious settlement. They have, therefore, brought their air lock into use, and have just commenced work under pressure. The men engaged in the operation of tunnelling are practical miners, and the mere excavation is no very serious business to them. It is to be feared, however, that the necessity for this special condition of their labour will tell painfully upon some of them. They have before them about 1,200 feet of tunnel to construct actually under the river, and at the central portion of it they will have above them at high tide somewhere about 80 feet of water and only about 7 feet of a loose and porous river bed. To keep out this head of water there must be an atmospheric pressure of about 35 lbs. to the square inch, over and above the ordinary pressure of the atmosphere. This is

the theoretical necessity, at all events, though it is said that in practice something considerably under what theory seems to require is found sufficient in such work. It is, however, a pressure great enough to cause some men serious distress, and, of course, the undertaking is beset by peril for all engaged in it. It is a satisfaction to know that the County Council has made special provision for the insurance of the lives of the workmen engaged here.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

7971. David Curr, for "An improvement applicable to chimney-tops."

7982. William Robb, Thomas Scott and Livingstone Rae Russell, for "Improvements in and relating to fireplaces."

8040. Alfred Clifford, for "Improvements in ventilators, smoke preventers for chimney-tops, soil-pipes, ventilating shafts for drains for public, domestic or factory buildings."

8058. William George Leatherbarrow and Joseph Bispham Leatherbarrow, for "An improvement applicable to windows."

8090. John McLoughland and William McLoughland, for "Improvements in and relating to swivelling windows."

8156. Charles Hitchcock, for "Improvements in chimney-cowls."

8201. Oskar Paul Zuchner, for "Improvements in draw-off cocks or taps."

8204. Hugh Garratt Forster Barham, for "Smoke-preventing chimney-pot and draught inducer."

8260. Alexander Brown and Robert Burns Barr, for "Improvements in and relating to fireplaces."

8314. William Phillips Thompson, for "A new or improved self-closing draw-off cock."

THE
Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TRADE NOTES.

MESSRS. PARSONS & HARRIS, of Sidney Grove, Goswell Road, have secured the order for warming the St. Bride's Institute, in Bride Lane, E.C.

THE Stafford School Board have accepted the tender of Messrs. Truswell & Sons, of Newcastle-under-Lyme, amounting to 244*l.*, for heating and ventilating the new Board school.

At the meeting of the Heywood Town Council it was decided to obtain tenders in connection with the new sewage works, which are estimated to cost about 20,000*l.*

TENDERS have been received for the construction of a permanent bridge to connect North and South Brisbane. Thirteen contractors in Brisbane and other parts of Australia have tendered, the highest offer being 130,699*l.* and the lowest 109,932*l.* Two or three ordinary bridges could be built with the 30,000*l.* difference.

THE Albion Clay Co. were adjudged an award for Sykes's patent joint pipes at the Chicago exhibition, in addition to the awards published in the list given in our last issue.

THE Local Government Board have now approved a loan of 4,446*l.* for land and 11,000*l.* for works of sewerage for the district of Rawdon, in Yorkshire. The sewage will be purified by chemical precipitation in tanks, followed by land filtration on 15 acres of land. The scheme has been delayed for some time through the arbitration for the purchase of the land. The engineer to the scheme is Mr. W. H. Radford, C.E., of Nottingham.

WE are asked to state that Messrs. Joseph Kaye & Sons, Limited, supplied the locks, bolts and latches for all the doors, including the lift doors, to the Royal College of Music, and also the gold-jewelled key for Mr. Samson Fox, which he presented to the Prince of Wales on his opening the above building.

WE understand that Mr. E. R. Dolby, C.E., of 8 Princes Street, Westminster, S.W., has been appointed consulting engineer to Messrs. C. H. Glover & Co., Hatcham Saw Mills, for electric-power transmission plant and electric crane; to the London Missionary Society for electric lighting; and to a colliery in Derbyshire for lighting, transmission of power and pumping by electricity.

At the meeting of the Royal Scottish Society of Arts Mr. Mathew Buchan read a paper on "The Practical Application of Electricity to Domestic and other Purposes." They were, he said, about to enter upon a new era in the history of illumination, for electricity would soon be circulating through the streets of Edinburgh. As probable consumers, the inhabitants of the city were more interested in the questions of pressure, Board of Trade units and cost than in that of production. An electricity meter would be supplied by the Corporation. This meter was guaranteed to register according to consumption. Fire was almost impossible if proper attention was paid to the rules and regulations of the Corporation and insurance companies. The Corporation did not undertake to do more than the gas commissioners did now, and the installation of electric wires would in time become part and portion of the plumbers' trade, but his advice was that they should not be trusted with the work in the meantime. Wires, switches, cut-outs and fittings must be installed by a private electric contractor, and the work must be done to stand the test of the Corporation's electrical engineer. Light for light the cost would be about 40 per cent. more than gas, but the saving in other directions by its use would materially reduce the price.

THE Ayr Town Council have instructed Mr. Hammond, electrical engineer, to proceed with measures for the introduction of the electric light, and remitted to the lighting committee to act along with Mr. Hammond. It is estimated that the first cost of the installation will be about 15,000*l.*

ELECTRICAL.

THE first section of the Douglas and Laxey coast electric tramway, extending from Douglas to Glen Groodle, has been opened for traffic. The cars ran the distance of four miles along the new marine drive with remarkable smoothness. Messrs. Mather & Platt, of Manchester, have constructed the line and put in the electric installation.

BUILDING AND BUILDERS.

THE Dean of Guild Court have granted a warrant to the trustees of St. James's Church to erect a new church in Carson Street. Messrs. Hardy & Wight are the architects. Accommodation will be provided for about 1,000, with a hall in addition to hold about 800, the estimated cost being 4,000*l.*

PUBLIC
BUILDINGS
THEATRES, &c.

It is proposed to build a large hall in Southwark for Wesleyan Methodist purposes, to seat 1,200 persons, at a cost of 22,000*l*.

THE memorial-stones of a Congregational chapel in course of erection at Rhosycae, in Flintshire, have been laid. The estimated cost is 1,200*l*.

THE Renfrewshire County Council propose to build a county hospital at Darnley, for infectious diseases, at an estimated cost of 11,131*l*.

AT the meeting of the Norton-under-Cannock School Board, a report by Mr. G. Barrett, architect, estimated the cost of enlarging Sheffield school, for the additional accommodation of 80 children, at 772*l*. 10*s*., and the building of a new school at Walsall Wood, providing accommodation for 160 children, at 1,358*l*. 14*s*.

THE question of providing additional accommodation (200 beds) for infectious diseases will be considered by the Edinburgh Town Council. The present hospital can be extended at a cost of 120,000*l*., including cost of land and clearing site. Another idea is to provide a new hospital somewhere in the suburbs.

A NEW Oddfellows' Hall is to be built at Nechells, Birmingham, from the plans of Mr. Daniel Arkell, architect, to accommodate between 400 and 500 persons. Mr. W. S. Seamark, of Lister Street, is the builder.

A NEW Catholic church for the Salford diocese is being built at Radcliffe, and another at New Wortley.

THE Alhambra Theatre and the adjoining hotel at Barrow have been purchased by Mr. Robertson, of Jarro, for 7,600*l*.

MR. PEARSON, R.A., has certified the following works to be urgently required to insure the safety of Peterborough Cathedral:—The extensive repair of the masonry of the north and south transepts, underpinning and repairs to the north-east angle of the eastern chapel, and erection of scaffolding in order that a careful examination of the west front may be made.

THE new public baths erected for Shrewsbury at a cost of 7,000*l*. have just been opened by Mr. Alderman Butler Lloyd, who in 1887 proposed their erection in commemoration of the Queen's jubilee. Mr. Lloyd recognised the assistance he had received in the matter from the public, the Corporation and the officials, and expressed his appreciation of the manner in which the work had been carried out by the architect, Mr. W. C. Eddowes, and the contractor, Mr. H. Farmer.

BEAUMONT HOUSE, Firs Road, Kenley, boys' school has been completely destroyed by fire, the damage being estimated at 3,000*l*.

PLANS have been prepared for the extension of the Public Baths in Storie Street, Paisley, by Mr. Moncur, master of works.

THE Board of Guardians, Kingston-on-Thames, are prepared to expend 1,500*l*. on the extension of the Workhouse Infirmary for Women.

THE Plymouth Borough Council propose to spend 2,500*l*. in extending the wholesale meat market and fitting up the Corn Exchange Chamber.

THE new premises of the Writers' Club at Hastings House, Norfolk Street, Strand, will be formally opened to-day (Friday) by Princess Christian, president of the club.

THE new workhouse infirmary at Beverley has just been opened. The building was designed by Messrs. Hawe & Foley, architects, in Queen Anne style, and carried out, including furnishing, for 4,400*l*., or about 75*l*. per bed.

AT the meeting of the Selkirk Town Council the plan of a proposed combined hospital for the county and burgh was submitted and approved. The plan shows a building for eight beds, two duty-rooms and other accommodation, and the probable estimated cost is 890*l*.

THE church erected at Paisley in memory of the late Mr. Thomas Coats, by his widow and family, at a cost of 100,000*l*., has just been completed.

AN extensive scheme of chapel renewal and building has been decided upon in the Wesleyan Norfolk Street (Sheffield) circuit. The scheme embraces the purchase of the freehold of Park Chapel, alterations at Darnell, improvement of Ellesmere Road Chapel, new schools at Don Road, alteration of Carbrook Chapel, and erection of a new chapel at Blackburn. The outlay will be not less than 11,000*l*.

SOME time ago Mr. W. Younger, of Auchencastle, offered to present Lockhouse Tower and twenty-eight acres of land to the town of Moffat for a recreation-ground. Owing to the apathy of the people in accepting the gift, the offer has been withdrawn.

VARIETIES.

THE annual provincial conference of the Sanitary Inspectors' Association was held at the Nottingham Exchange, about 100 members attending from London, Manchester, Liverpool, Wigan, Newcastle, Stafford and other centres. The proceedings were opened by the Mayor. The president of the Association, Sir Benjamin Ward Richardson, had prepared an inaugural address, which was read by Dr. P. Boobhyer. The municipality was complimented on the great sanitary progress it had made during the last thirty years, which was proved by the gradual reduction in the death-rate of the town.

THE Wednesfield School Board have decided on a site which they intend to purchase for the erection of a school for 300 children.

THE technical instruction committee of the Lancashire County Council are convinced that a county school of horology is urgently needed in Lancashire upon the lines of the excellent horological schools on the Continent. With this object in view the committee has arranged to hold a conference with the leading firms in the watchmaking trade and other authorities interested in the subject at the Sessions House, Islington, Liverpool, on the 28th inst. To this conference all persons engaged in the watchmaking trade or interested in the establishment of a horological school are invited.

AN inquiry has been held into the application by the Birmingham City Council for sanction to borrow 7,175*l.* for the improvement of the river Rea, 4,500*l.* for the improvement of Hockley Brook, 3,990*l.* for the purchase of land as a site for public baths and library at Balsall Heath, and 3,000*l.* for the purchase of land for purposes of the Carr Street improvement. At the same time the Aston Local Board sought power to borrow 4,500*l.* in respect of their share of the work of improving Hockley Brook.

THE Arbroath ironfounding, engineering and boiler-making business, belonging to Messrs. Alexander Shanks & Son, has just been purchased at a reduced upset of 13,000*l.* on behalf of a limited company just formed.

THE Leamington Town Council propose to borrow 4,280*l.* for waterworks and sewage disposal purposes.

AT the meeting of the Manchester Geological Society at Wigan, a discussion took place on the question of the mechanical ventilation of mines, in connection with a paper read at a previous meeting. One point raised was the comparative

economy in the consumption of fuel in fan ventilation as compared with the furnace ventilation of collieries, which was shown to be greatly in favour of mechanical appliances, and, apart from economy, mechanical appliances were in the matter of safety far preferable to furnace ventilation. Mr. C. M. Percy read a short supplementary paper on the subject, and said a very substantial reduction in the consumption of fuel might be effected by the introduction of modern mechanical ventilating appliances, which in the future would comprise comparatively small, quick-running fans and compound condensing engines.

IN the arbitration case of James Waddell & Sons, the firm who constructed the Scarborough and Whitby Railway, versus the North-Eastern Railway Company, Mr. A. M. Dunlop has given his award. The case was heard at Scarborough and in London. The claim, as urged by Mr. Cripps, Q.C., had reference to land at Gallows Close, situate north of Scarborough and Whitby tunnel at Scarborough. The North-Eastern Railway Company obtained compulsory powers to take the land in 1891, an action at law being tried previously. On behalf of the company, the arbitration witnesses assessed the property at from 4,461*l.* to 4,987*l.* Mr. Dunlop has awarded 13,035*l.*

AN inquiry has been held into the application of the Epsom rural sanitary authority to borrow 1,300*l.* for a drainage scheme for Cheam and Cuddington parishes.

THE Ilfracombe Local Board require a loan of 4,600*l.* for works of water supply, street improvements, fire-engine house, &c.

IT is stated in the *Board of Trade Journal* that the improvement reported last month in the building trades has been maintained, the percentage of unemployed in unions connected with these trades having further fallen from 3.5 to 2.8. In the furnishing and woodworking trades an improvement is also noticeable, the percentage of unemployed members of unions having fallen from 4.2 to 3.2.

THE new lock at Richmond will be opened by the Duke of York to-morrow.

DR. EVANS, medical officer of the Local Government Board, has suggested to the Holywell Union more systematic arrangements for the scavenging of Connah's Quay, Bagillt, and Greenfield. The condition of the houses of the working classes he severely condemned as damp, ill-constructed, ill-ventilated and overcrowded. A large number were totally unfit for habitation.

CHIMNEYPIECE, TRING PARK, TRING.

A HOUSE IN BEDFORD PARK, CHISWICK.

ASHCROFT GARDEN FRONT.

THE WATKIN TOWER.

WEMBLEY PARK was opened to the public on Saturday, Whitsun Eve. Its chief feature, the Watkin Tower, named after its projector, is yet in the first stage of its construction, and many months must elapse before it is completed. The park occupies one of the pretty well-wooded portions of Middlesex. The land has been admirably laid out, without destroying its natural beauties, by Mr. H. E. Milner, and perfect arrangements have been made for sports of all kinds. There is a lake, with a uniform depth of 3 feet, to which the river Brent, which runs through the park, is made to contribute, and the beauty of the scene has been enhanced by the erection of pretty bridges, and by the introduction of a waterfall and other attractions. The lake altogether covers eight acres. Apart from the tower, which its designer intends shall reach a greater altitude than the Eiffel Tower, it is stated that 20,000*l.* has been expended on the buildings in the park, which comprise refreshment pavilions, band-stands, dressing-rooms, conservatories, and a tea pagoda.

THE Lee-on-the-Solent Light Railway, having been inspected and passed by the Board of Trade, has just been opened for traffic. The line is a little over three miles in length, and connects the new Hampshire sea-side watering-place of Lee-on-the-Solent, on the estate of Sir J. C. Robinson, with Brockenhurst station of the London and South-Western Railway. The engineer is Mr. P. W. Neik, the gauge is the usual one, and the permanent way is laid with 60 lbs. steel rails. The contractors were Messrs. Pauling & Elliott. The carriages are of special construction, somewhat resembling miniature Pullman cars.

FLOATING WAREHOUSES FOR MANCHESTER.

THE following report by Mr. Llewelyn J. Dedwydd on warehouse accommodation has been prepared for the Manchester Chamber of Commerce:—

34 Pall Mall, Manchester: May 7, 1894.

Sir,—At your request I have the honour to report that since the opening of the Ship Canal the want of suitable warehouse accommodation on the docks has not only proved a serious drawback and inconvenience to the trade, but it has been made clear that until such facilities are provided no large parcels of grain, cotton and sugar can be dealt with as at other ports, and this is preventing in some important directions the growth of the traffic. There is no land available in Manchester or Salford above Mode Wheel for erecting warehouses abutting on the canal where steamers could discharge direct into store. Mr. J. K. Bythell, chairman of the general meeting of shareholders some few weeks ago, dwelt upon this vital question at some length. It is proposed to form a company to supply store accommodation direct from the importing ship's side.

The object of the company is to build "floating warehouses" for use upon the upper and lower reaches of the waterway (at such points as per agreement with the Canal Company), to accommodate any cargo that will arrive on speculation or to be held by speculative merchants and brokers, which is generally not sold on arrival, and therefore put into store. The "floating warehouses" upon the lower reaches of the canal will serve such large ships and steamers (even Liverpool liners) as cannot pass under the fixed bridges owing to the height of their masts or the cost of dismantling and towage up and down with two tugboats. This will apply to ships with grain from Australia, New Zealand and the West Coast of America, ships with nitrate from the Pacific coast of South America, vessels loaded with flour and fish in cases from San Francisco. Upon the upper reaches the "floating warehouses" can be placed alongside discharging ships without hampering the quay space, their chief utility being their adaptability as moving warehouses more than the carriage of merchandise. The "handling" on the docks and carriage either by cart, rail, or boat, from the importing ship's side, will be entirely obviated. This will apply to cargoes of cotton, sugar, farina, &c. The principal corn merchants of Manchester and district have subscribed to the following statement:—"The consumption of cereals, including wheat, flour, barley, oats and maize, is greater in the district of which Manchester is the

centre than in any other part of the United Kingdom." The importation per annum to this district is about—Cereals, flour, &c., 1,500,000 tons; nitrate, 35,000 tons; fish in cases, 8,000 tons; cotton, 500,000 tons; sugar, 200,000 tons; farina, 50,000 tons; total, 2,293,000 tons. The bulk of this arrives on "speculation" and requires warehouse accommodation. I have interviewed Liverpool, Hull and London merchants and brokers interested in this trade. They all say, "Give us direct warehouse room and we will work a trade; Manchester is the greatest centre for distribution in England." The writer has had several years' commercial experience on the rivers Elbe and Rhine, where the largest traffic in the world is carried on over "floating warehouses." The trade of Hamburg and the towns upon the Upper Elbe is largely served by large barges or "floating warehouses," and the trade of Rotterdam is similarly served, with the large Rhine cities, viz. Cologne, Coblenz, Frankfort and many other towns. I maintain that facilities in the shape of "floating warehouses" upon the Ship Canal would meet the difficulty in Manchester.

It is obvious that the bulk of the 2,293,000 tons will be carried in sailing vessels (or steamers) that will not sail above Runcorn Bridge. This bulk can be served by the proposed warehouses, and stored free for thirty days, at less than the cost of cartage and handling from ship to a Manchester warehouse, which cost can be entirely saved; and for this saving it can be delivered into railway at any point between Eastham and Manchester, or into inland barges, as ordered by the merchant or consignee. This sum alone will be sufficient to pay a fair rate of interest upon the first cost of the warehouse. I may here mention that the scheme is receiving the united "moral" support of the canal directors, and several important concessions have been granted by the Ship Canal Company with reference to the dues and the general working of the traffic. The cost of transit from canal to warehouses and redelivery into inland barge or railway per month shows in favour of floating warehouses:—

Articles.	Cotton.	Sugar.	Grain.
	s. d.	s. d.	s. d.
Charges in city store . . .	9 5	8 1	7 4
In floating store . . .	5 9	5 1	4 5
Profit for merchant . . .	3 8	3 0	2 11

My object in bringing the matter before your Chamber is to ask it to inquire fully into the merits of the scheme. Should it be found of assistance for the development of trade over the

canal and Manchester district, may I venture to ask for your assistance in placing the scheme before commercial gentlemen who would be likely to co-operate in bringing it into practice? I may say that Mr. Joseph Verdin, of Northwich, and Mr. Morton, managing director of Messrs. Fellows, Morton & Co., Limited, who handle a very large traffic, have consented to become directors, provided two or three well-known local gentlemen will join the Board.—I remain, &c.,

LLEWELYN J. DEDWYDD, a Lloyds Agent.

Mr. Elijah Helm, Secretary Manchester Chamber of Commerce.

LOCKS AND LOCK FURNITURE.

EIGHT of these beautiful samples of locksmith's work have been made for Lord Portman's house, Bryanstone, Dorchester.

They were designed by Mr. R. Norman Shaw, R.A., and made by Mr. James Gibbons, 9 Southampton Row, London, W.C., and Wolverhampton.

SAND IN MORTAR.

It was the opinion of Vitruvius that pit sands were preferable for mortar, but he says that they must be freshly dug, otherwise they are decomposed by the action of the atmosphere and become earthy, and in this state they make bad mortars. Alberti, Palladio, Philibert Delorme, Blondel and some other writers agree in these opinions, but Belidor thinks that river sand is best, and that it should be sharp. Palladio considers that white sands are worst. Belidor states that colour has nothing to do with the matter. Rondelet, in consequence of these contradictory opinions, made experiments himself on the subject, with the following results:—(1) That the glassy or quartzose sands form with lime a weaker mortar than mixed

sands, and that such mortar is longer drying. (2) That pit sand produces a better mortar than that made with river sand composed of grains of the same size. He did not find that the sharpest (*blus arides*) sands made the best mortar, but thought that of sands of the same kind those which were deepest in colour, excepting the yellow, were to be preferred. The best sands, he states, are such as hold a middle place between those which are very plastic and very sharp. On comparing mortars made with freshly-dug pit sand and the same sand washed and dried in the sun, the sharp (*arides*) grains only being left, he found that the first acquired the greatest hardness, and that mortar made with very fine sand did not harden so well as that made with sand of a moderate-sized grain.

All these authors considered sea sand the worst, but Alberti mentions an exception. The sea sand from the neighbourhood of Salerno he found to be as good as the best pit sand.

Treussart appears to think there is not much difference between river, sea and pit sand, and he believes that the discordant results obtained by preceding writers were occasioned by their having employed sands more or less fine or more or less earthy. If they did not wash their sand, the superiority which they found to belong to either may have been, he thinks, on the one hand due to the greater freedom from earthy matters of the better sand of the two, and on the other to the greater fineness of the particles. His experiments indicated fine sand to be preferable to coarse, but he states that many constructors think coarse sand to be preferable for heavy masonry, and he believes that the prism, made with coarse sand in the experiments from which he draws his conclusions, was cracked without his perceiving it, its resistance having been so feeble. He considers, however, that it is certain that there is an advantage in the case of hydraulic limes in making mortar of fine sand. When he employed pit sands he always washed them, but points out that it is necessary before doing so to ascertain that the sands are not *arènes*. He finally decides that fine sand affords much better results than coarse, both in air mortars and water mortars, notwithstanding the opinion to the contrary of most constructors. His remark concerning the washing of *arènes* suggests the possibility that Rondelet made his experiments on this sort of sand, and thus obtained the otherwise anomalous result of a deterioration in the sand by washing.

Vicat concluded that the advantage of the three different descriptions of sand employed by him varied with the nature of the lime. He calls coarse sand that whose grains, supposing

them round, vary from one-seventeenth to one-eighth of an inch in diameter; fine sand, that where the grains vary from one-twenty-fifth to one-seventeenth of an inch in diameter; powders, such solid substances as have no particles equal to one-hundred-and-twenty-seventh of an inch in diameter. Powders, especially when derived from calcareous substances, he found to make excellent mortar both with hydraulic and eminently hydraulic mortars. He thinks that the greatest difference in the hardness of mortars of the rich limes which the use of this or that sand occasions, rarely amounts to one-fourth of the hardest, but that with hydraulic and eminently hydraulic limes it may exceed one-third.

Raucourt de Charleville considers that sand from the banks of rivers is better adapted for mortar than that which is procured from the middle of their beds; in the latter position the particles are rubbed smooth, but on exposure to the air the surfaces of the grains become pitted and adhere better to the lime. He found that mixed sand that is a mixture of coarse and fine grains was most economical.

Worledge observes that fine sand makes weak mortar, and that the larger the sand the stronger is the mortar. Dr. Higgins prescribes a mixture of fine and coarse sand.

Smeaton remarks:—"That Vitruvius was not only a judicious but a practical observer, as well in regard to mortar as other articles of building, appears from the distinction he makes between sharp river sand and pit sand, which is generally soft, for of river sand he allows but two (of lime) to one of sand. I have long since found the necessity of forming a composition of fine and coarse sand for mortar, unless the sand is naturally so mixed, for as the lime will receive most sand in that way without losing its plasticity, it will of consequence make the hardest and firmest mortar. My practice has uniformly been, if there was plenty of one sort of sand and a scarcity of the other to make the mixture by allowing of the most plentiful sort as far as the proportion of two to one."

Peter Nicholson states that the coarser the sand the stronger is the mortar.

THE Duke of Connaught has sent in to the War Office strong representations upon the insufficiency of the lighting accommodation of the Aldershot Camp, and has recommended, both for sanitary reasons and in the interests of discipline, that the lighting power be increased and that gas be laid on without delay throughout the garrison.

NOTICE.

Mr. JOHN GRUNDY has purchased the whole of the Valuable Stock and Patents of The Helios and Calorifer Stoves from Mr. H. HEIM, of Vienna and Oxford Street, London, W.

The Premises 95 and 97 Oxford Street will be open until June 24, and Architects and Builders are invited to call, as the stock, which is a very valuable one, will be sold at greatly reduced rates.

HEATING APPARATUS.

THE SURVEYORS' FORESTRY MUSEUM.

A CATALOGUE has been published of the forestry museum at the Surveyors' Institution, 12 Great George Street, Westminster. The object of the collection is to represent purely British forestry, and it is intended to be of instructional value to those who are interested in the management of British woodlands. Samples are shown of the timbers of our indigenous or naturalised trees, and there is an interesting collection of transverse, radial and tangential sections of woods. The pathological specimens include beech and Spanish chestnut damaged by woodpeckers, Scotch fir infested with *Sirex juvencus*, pine with loose knots caused by allowing dead branches to remain on young or middle-aged trees, and a series of insect injuries to oak, fir, willow and ash. A sample of larch planted in 1861-62 and cut in the spring of 1893 should prove of special economic interest. The trees from among which it was cut were grown on a loose, rocky, mixed soil, forming a railway embankment, in county Louth, Ireland; they were planted on a steep slope, and 4 feet apart every way. The value of the land was about 4d. per statute acre, its natural growth being rough grass, briar and furze. From the droppings and shelter of the larch a skin of fine grass has now formed on the surface, and if the plantation were cut down the land would be five times as valuable for pasture as it would have been had the trees never been planted. Where the plantation was thinned in time some of the trees measure 3 feet in girth outside the bark at about 1 foot above the ground, this corresponding with a diameter of $10\frac{1}{4}$ inches inside the bark. On another embankment, 12 miles north, in a mountain district, similarly formed of earth and *débris* of granite, the trees are rather grosser, measuring up to $12\frac{1}{4}$ inches diameter inside the bark. If two-thirds of these trees were now cut down, at their present value of 1s. 6d. to 2s. each, the remaining third would, in a period of twelve years, be worth 5s. each for railway sleepers, assuming that the butt would make two sleepers and that the lop would pay for cutting and sawing. Experience goes to show that larch sleepers grown on rocky ground are as lasting as creosoted Baltic sleepers, besides being stronger and less liable to split; good red larch has lasted for as long as twenty-two years in a railway. A larch tree planted in 1859 on good land, sheltered, now measures $15\frac{1}{4}$ inches diameter inside the bark. This is the end tree of a row; the others contain as much timber because they are taller, though their diameter is only 11 inches at the butts.

THE BLACKPOOL TOWER.

THIS structure, in connection with which over 200,000l. has already been spent, has been in course of construction for over two and a half years. The surrounding buildings are not yet completed, but the tower itself is in such an advanced state that the directors decided to throw it open on Whit-Monday. As yet one elevator only is working, and this was going up and down with hardly a minute's interval from morning to night. About 500 people an hour were taken to the top, where there is promenading space for over 1,000, and the elevator worked smoothly throughout. The foundations of the Blackpool Tower, which are great blocks of concrete 40 feet square by 12 feet thick, were constructed during the winter of 1891-92. The contractors for the tower, Messrs. Heenan & Froude, of Manchester, got to work in the spring of 1892, and the work of erecting the tower was completed about Christmas last. The tower proper is supported by four legs, each leg consisting of four pillars braced together with lattice girders, while the legs themselves are also braced together with the main girders. The base of the tower forms the circus, and here there is seating accommodation for over 5,000 persons. The first main floor is 55 feet from the ground, and this large area is entirely covered in. Broad flights of steps lead to it from the entrance-hall, while two small lifts are also constantly ascending to this floor. From the staircases also the platform, 85 feet from the ground, can be reached. It is intended to lay this out as a pleasure-garden, and it is expected that it will form a popular lounge and promenade, as there will be accommodation on it for several thousand people at one time. The elevators to the top of the tower start from the 55-foot platform, and the main balcony at which the passengers by the lifts arrive is formed at a level 380 feet above the ground. The area at this height is 44 feet square. The platform to which the cars ascend is entirely covered in. From this 380-foot platform access is gained by two staircases to the open-air platforms above, respectively 400 feet and 420 feet from the ground. A spiral staircase leads to the higher platforms, and finally there is an iron ladder to the "crow's nest," which is over 500 feet from the ground and 550 feet from the sea level. The two lifts to the top of the tower run quite independently of one another. They can accommodate about forty-five passengers each, and while the weight of the car and passengers combined can never exceed ten tons, the seven steel ropes attached to each car have been tested to carry a weight at least ten times as great.

THE GRANITIC PAINT

IS THE
BEST FOR ALL PURPOSES.
SILICATE ZOPISSA COMPOSITION
Is a thorough Cure for Damp Walls, and is made IN ALL COLOURS and COLOURLESS.

A SILVER MEDAL was awarded at the INTERNATIONAL HEALTH EXHIBITION, 1884, for Excellence and Durability.

The Original Inventors and Sole Manufacturers,
THE GRANITIC PAINT COMPANY,
32 King Street, Cheapside, E.C.
ESTABLISHED 1860.

Then safety brakes are attached which come into action automatically should anything go wrong with the mechanism. Every possible care has been taken to make the elevators perfectly safe. The north wing of the building is not yet completed, and the various surroundings of the tower are as yet unfinished, so that the opening was of an informal character.

CHESTER HABITATIONS.

THE Medical Officer of Health for Chester in his annual report on the public health says:—"The health committee have had under serious consideration the question of providing additional house accommodation for the poorest classes. It is computed that 319 houses, occupied by the poorest classes, have been removed as unfit for habitations, or to make room for other buildings during the last twenty years, and quite 385 houses, under 5s. per week rental, have been built during the same period within the city, besides many in the suburbs. A table extracted from the census report of 1891 of special interest in regard to the housing of the working classes shows that there were at the time of the census in Chester 7,481 inhabited houses. The 7,481 houses were some of them sublet, so that the number of separate tenements was 7,717. Of these 3,696 separate tenements, 145 consisted of one room and were occupied on an average by 2.4 persons per room; 648 separate tenements consisted of two rooms each, and were on an average occupied by 1.6 persons per room; 587 tenements consisted of three rooms, and were occupied on an average by under 1.5 persons per room; 2,316 consisted of four rooms, and were occupied on an average by 1.1 persons per room. The total population so housed was 15,489. The remaining 22,016 persons in the city occupied tenements of five rooms or more at the average rate of 1.1 or less per room (5.4 per tenement). The average proportion of persons to houses of all sizes was in Chester—in 1861, 5.21; 1871, 5.238; 1881, 5.125; 1891, 4.96, showing a steady decrease in the proportion of population to houses. In fact, between 1881 and 1891 the increase in the number of houses in the city was almost identical with the increase in the number of the population. 302 houses have been built during that decade, and only 311 additional inhabitants by way of increased population; so also in the suburb of Hoole houses increased more in proportion than inhabitants during the decade, 219 houses being added and 993 population.

EARL'S COURT INDUSTRIAL EXHIBITION.

THIS exhibition was opened by the Lord Mayor. A general exhibition of industrial and commercial inventions are being rapidly put in position, but the main feature of the exhibition will be London's latest popular attraction—the Graydon gigantic wheel and recreation towers. The Watkin tower at Wembley Park will have a formidable rival for popular favour in the Graydon gigantic wheel and recreation towers, which are to be the new attraction at Earl's Court. The wheel, which will be 300 feet high, will have suspended on its periphery forty carriages, hung on steel spindles in such a manner as the floors will always be level. The axle of the wheel will be formed of a tube 50 feet long and 7 feet in diameter, and will therefore be large enough to permit of a couple walking through without stooping. The wheel, when fully loaded, will accommodate 1,600 people, while the towers will hold as many more in the ball-rooms and restaurants. A revolution of the Graydon wheel will exalt the passengers in its forty cars by 300 feet above the groundings, and they will be given (on a fine day) a magnificent view of London and its environs. When one remembers how many steps one has painfully climbed to get a less easy view it can hardly be doubted that we shall all do the circular trip at Earl's Court, rising as if in a balloon in a comfortable carriage without risk and without exertion. A novelty about the Graydon wheel is that one can walk through the axle from tower to tower—that is to say, while the wheel is in motion. This fact in itself will give readers an idea of the immense size of the projected wheel.

EDINBURGH OVERHANGING SIGNBOARDS.

As a good deal of interest is being taken in this question, it may not be amiss, says the *Scotsman*, to explain how it has come to the front at the present time. It appears that a year or two ago a remit was made to the streets and buildings committee, on the motion of Mr. Macnaughton (then one of the councillors), to consider the question of overhanging signboards, &c. Nothing was done at that time, but in the end of last year the question was raised in a practical form by complaint of a huge signboard which the Salvation Army hung out over the door of their premises in Nicolson Street, and which extended right across the pavement. The streets and buildings committee having had their attention called to this "obstruction," put in

force the powers with which they are armed by the 151st section of the local Police Act. By letter and otherwise the committee were urged to take further action against similar "obstructions" elsewhere, and it was in these circumstances that the old remit was revived, the committee feeling that if the law was to be put in force at all, it must be impartially against all offenders under the section. The printed minutes of the Town Council contain a record of the further procedure. In the minutes of March 16 the following appears:—"Edinburgh: February 27, 1894.—At a meeting of the sub-committee of the streets and buildings committee, under remit on the subject of objectionable signboards, lamps, &c., throughout the city—present, Bailie Dunlop and Councillors Brown and Walker. Read report by the burgh engineer. The sub-committee beg to recommend that the magistrates and Council order the removal of the encroachments, obstructions or projections at the undernoted places, and that within two weeks from the date of the service of the notices." Then follows a list of about 750 shops where such obstructions exist. The minute goes on to say:—"Edinburgh: March 2, 1894.—The streets and buildings committee approve of the following report, and beg to recommend the magistrates and Council accordingly," and on March 16, "the magistrates and Council approved of the foregoing report, and resolved as therein recommended." It is further stated that "during the discussion of a report by the streets and buildings committee on a letter by Mr. George Washington Browne, architect, on behalf of Messrs. Redfern, recommending declinature to allow a sign erected by them at their premises at 31 and 32 Princes Street to remain, attention was called to the fact that there was not a quorum present, and the House was counted out." But at the next meeting of Council (March 20) it is minuted that the magistrates and Council approved of the foregoing report, and resolved as therein recommended.

SEWAGE PURIFICATION IN GLASGOW.

THE works for the purification of sewage in the eastern district of Glasgow were inaugurated on the 2nd inst. They are the first part of the great scheme for the purification of the river Clyde. As they stand the works are capable of dealing with 10,000,000 gallons of sewage per day, or about one-fifth part of that from the entire city, and they can be extended to treat twice that quantity. The buildings and tanks cover an area of

nine acres out of twenty-eight purchased and available. The land cost 38,000*l.*, and the buildings, tanks and machinery an additional 62,000*l.*, or 100,000*l.* in all. This sum is irrespective of the 300,000*l.* spent by the Caledonian Railway Company in constructing new sewers to the works, an expenditure undertaken in connection with the underground railway scheme, which necessitated the removal of many of the old main drains.

The visitors were conducted to the sewage entrance chamber, where samples of the raw sewage were taken. Thence they proceeded to the main building and viewed the pumping, mixing and pressing machinery. As the sewage ran to the main building it passed through rotary screens, which took up floating matters, afterwards passing to two large catch-pits, depositing the heavy matter by its own gravity. These heavy deposits were moved forward by screw conveyers and lifted by elevators to a level sufficient to empty themselves into railway waggons. From the catch-pit the sewage ran into a well situated below the pump-room, to which the visitors were conducted through the engine-room, workshop and boiler-shed. After leaving the pump-room the mixing pit was shown, where the sewage coming from the main pump delivery pipe mixed with the chemicals, sulphate of alumina and lime, to precipitate the impure matters. Samples of the sewage mixed with the chemicals were taken. Afterwards the sewage flowed into the precipitation tanks outside, the sludge deposited flowed back into a large tank under the rooms in which the visitors viewed the sulphate of alumina tanks and lime mixers. From this tank the sludge was pumped into the sludge mixers, where a small quantity of lime was added. It then flowed into four sludge rams. Hence it was forced into presses by compressed air to expel the water, which flowed back to be repurified, the sludge falling into railway waggons below the pressing-room. After seeing the sludge-presses the visitors proceeded to the precipitation-tanks outside the main building, arranged in two rows of twelve tanks in each row, each tank holding 30,000 gallons. In ordinary working each tank will be filled in rotation, and the sewage allowed to come to complete rest for about an hour. The liquor was then drawn off and aerated by being run in thin sheets over the stepped bottoms of twenty-four aeration-beds. Any sludge remaining in the precipitation-tanks goes back by an underground channel to the main building to be again treated. The liquid from the aeration-beds flowed through three iron syphons under Swanson Street to the filters on the west side. The visitors were conducted from the precipitation-tanks to the

filters, which consist of sixty tanks, of which twenty were filled with gas-coke and forty with gravel and sand. The sewage, after treatment in the main building, entered the precipitation-tanks, passing over the aeration-beds and then coming to the filters. After passing through these, it was an effluent pure enough to go from the outlet channel into the Clyde.

KEIGHLEY WATER AND SEWAGE WORKS.

LAST week there was a meeting of members of the Incorporated Association of Municipal and County Engineers at Keighley. Mr. W. H. Hopkinson read a paper describing the Keighley water and sewage works. With regard to the water-works, he explained that in 1816 a private company was formed for the purpose of supplying water to the inhabitants from small springs near the town. In 1855, when the company was only able to supply the inhabitants with about six gallons of water per day per head of population, the then Local Board of Health resolved to purchase the undertaking, and paid the sum of 17,000*l*. The Board then commenced looking for fresh water supplies, and in 1869 received sanction to a scheme to construct necessary reservoirs. The scheme comprised the construction of a high-level storage reservoir called Water-sheddles, on the Pennine Range, at the head of the river Worth, in the township of Trawden, Lancashire; a mill-owner's compensation reservoir called Ponden, some two miles lower down the stream; the construction of a low-level storage reservoir called Bully Trees, in the township of Haworth, on the Sladen stream, which is a tributary of the river Worth, with a millowner's compensation reservoir called Lower Laithe, at the foot of the bank of the last-mentioned reservoir, and the making of catch-water conduits, and laying of mains from the storage reservoirs to the service filter reservoir called Black Hill in the town. The Local Board constructed Water-sheddles storage, Ponden compensation, Black Hill service, with necessary conduits and mains. The total storage of water in all the reservoirs for the town's use is about 170,000,000 gallons. Though considered very pure, the water is soft, being about 1½ degrees of hardness. On account of the water containing an acid which acts upon lead service pipes, the Corporation in 1884 laid down at Black Hill reservoir an open conduit, and placed therein a quantity of Derbyshire limestone, through which the water had to pass. The water was hardened, but not sufficiently to stop the action on the lead pipes. About

100 lbs. of fresh fallen lime was then placed daily in the conduit, and this raised the water to 2 degrees of hardness, which had the effect of stopping the action upon the lead pipes. In 1892 the filter of Black Hill showed signs of not passing the water through freely, and the Corporation thereupon decided to push on with the new filter-beds at Oldfield. The works are now being carried out, and Mr. Hopkinson explained his designs for them in detail. Passing on to deal with the sewage farm, the writer of the paper stated that it is situated at Marley, in the Bingley Local Board district, and is laid out on the "intermittent downward filtration" principle. No sewage has yet been brought on to the farm. The area laid out, including beds, banks and roads, is 36 acres, of which 32 acres are in beds. The land is underdrained 6 feet deep, with 9-inch and 6-inch pipes one chain apart. The sewage will not be treated in any way beyond screening. The nature of the ground varies, a large portion being loamy soil 6 feet deep, another portion is gravel, and another portion clay and sandy clay overlying gravel. The farm is laid out to deal with the sewage of 1,000 persons per acre, but if this is found to be insufficient, the Corporation have a large reserve of land for further extensions. The estimated cost of the sewage farm and sewerage scheme is 31,000*l*.

ENGINEERING LABORATORY, CAMBRIDGE.

THE new engineering laboratory, which was formally opened on Monday by Lord Kelvin, mainly owes its existence to the contributions of a number of noblemen, men of science and engineers, who have most liberally responded to an appeal issued in March 1891, signed by the then Vice-Chancellor, Dr. Butler, Master of Trinity College, the Master of Peterhouse, Professors Cayley, Thomson, Ewing and other influential members of the University. It was pointed out that the establishment of a school of engineering at Cambridge was a matter of more than local importance, that it would enable the exceptional facilities which Cambridge offers for the study of mathematical and physical science to be taken advantage of by students of a subject to which such study is peculiarly relevant, it would allow students of engineering to obtain a professional and scientific training of the most appropriate kind without sacrificing the general advantages of University residence, it would probably draw out a few men of mathematical ability into a profession they would otherwise not enter upon,

and it might become a training ground for teachers of applied mechanics whose work in technical schools and classes throughout the country has a wide influence on the industrial population.

An influential committee was formed, consisting of the chief officers of the University, members of the Royal Society, the Institutions of Civil, Mechanical and Electrical Engineers. Upwards of 5,000*l.* was subscribed, including 1,000*l.* from the late Chancellor, the Duke of Devonshire, and, in addition, valuable presents of plant and appliances were given. The University contributed 1,000*l.*, and thus the funds for the new building were obtained. The design of the architect, Mr. Marshall, has not been fully carried out, inasmuch as the erection of the north wing, estimated to cost 2,500*l.*, is postponed for want of funds, and a further sum of 1,000*l.* is required to provide additional apparatus. The new building stands on the site of the old Perse school in Free School Lane; the old hall of the school, with its fine roof, is retained, and forms a mechanical laboratory. The central front block contains on the first floor a room for teaching drawing, with accommodation for about fifty students. Below this room are the electrical laboratories, and above a museum in which the collection of mechanical models formed by the late Professor Willis will be placed. The south wing provides necessary offices, professors and demonstrators' rooms, and a laboratory for advanced work. Behind and partly below the hall of the old Perse school is a steam laboratory with a floor area of about 3,400 square feet. On the roof are tanks for hydraulic experiments. The steam laboratory contains the following engines arranged for experimental work, viz. horizontal steam-engine for driving dynamos, vertical steam-engine with surface condenser, Parsons steam turbine, Worthington steam-pump, Otto-Crossley gas-engine, Hornsby-Ackroyd oil-engine, Rider's hot-air engine and Robinson's hot-air engine. The makers of the engines have supplied them at greatly reduced prices in consideration of the use to which they are to be put. The officials of the Treasury, at the instance of Mr. Preece, C.B., engineer-in-chief of the Post Office, have presented a large dynamo. It may here be stated that a large part of the work of the equipment and erection of the laboratory has been done by the workmen of the University workshops, and the cost has been met by the fees paid by the students.

The Vice-Chancellor, the Provost of King's, presided at the opening ceremony, which took place in the steam laboratory.

He said that the occasion on which they were assembled was a novel one, the opening of a building to be devoted to the teaching of engineering. Some had doubted the wisdom of the University in attempting this new study, but they were looking forward to learn farmers their business, and why not civil engineers? To Professor Ewing's exertions and indefatigable zeal was the erection of the building due.

Lord Kelvin, in the course of his address, justified the addition of the teaching of engineering as part of the University curriculum, and maintained that true education consisted in providing the most efficient means for the equipment of persons for the battle of life; and although the old system of scientific education possessed great merit, yet for a profession like engineering it required to be supplemented by a method of teaching such as the laboratory would supply. But it must not be supposed that the present laboratory was to be commended for its completeness; much more would be required both in appliances and buildings, which he trusted would be provided at no distant date. The establishment of an engineering school at Cambridge had already drawn to the University a number of earnest, hardworking students, who but for it would not have joined the University. Their presence could not but benefit the whole University, while the *status* of the profession would be raised by the introduction of men who had the advantages of University culture.

Professor Kennedy, who was introduced as the parent of engineering laboratories, also spoke as to the advantages to be derived from the movement.

Sir Frederick Bramwell, who humorously described himself as one of the mechanicians of the baser sort, said he was an example of the sort of person who had not had the benefit of a University education. He did not think he could ever have passed an examination, for he could never remember anything that would have been required of him by an examiner at the right moment. He had some little fear whether the danger did not exist of the future supply of engineers not exceeding the demand. Their numbers had enormously increased of late years, but he was sorry to say that the demand for their services was decreasing.

The proceedings terminated with a vote of thanks to the Vice-Chancellor, proposed by Professor Jebb, M.P., seconded by Professor Ewing. The latter speaker dwelt upon the necessity of the early completion of the building. The company then separated to view the different rooms of the laboratory, the demonstrators and students explaining the use of the

THE AUCTIONEERS' INSTITUTE.

THE dinner of the Auctioneers' Institute of the United Kingdom has been held at the Inns of Court Hotel, Lincoln's Inn Fields. The president, Mr. George Brinsley, took the chair. Among those present were Mr. W. H. Willans (president of the London Chamber of Commerce), Mr. A. C. Morton, M.P., Mr. J. Catling, Mr. Thomas Catling, Mr. C. Appleton, Mr. Allen Drew, Mr. John Woodhouse, Mr. W. R. Peck, Mr. John Hepper, Mr. E. W. Richardson, the mayor of Chatham (Mr. C. T. Smith), Mr. T. A. Taylor, Mr. W. Booth, Mr. E. Dobson, Mr. B. M. Bradbeer, Mr. S. Heywood, Mr. E. J. Vaughan, Mr. H. Bushell, Mr. W. G. Howgrave (secretary of the Institute of Chartered Accountants), Mr. W. J. Stansfield, Mr. J. Windham, Mr. J. Saville, Mr. W. H. Elwell (surveyor of the Great Northern Railway), Mr. C. Clarke and the secretary, Mr. Charles Harris. The toast of the evening was proposed by Mr. Richardson, who remarked that the Institute, having overcome the difficulties it encountered at the outset of its existence, was now in a most satisfactory position, and had become a power in Great Britain as the recognised authority of their profession. The Chairman, in reply, said that he had been one of the first to join the Institute, feeling how necessary it was to the interests they had to promote. He did not see why auctioneers should not have the same protection as other professions in this country. It was imperative that those who joined the profession should be qualified to pursue it, and the longer the Institute lasted the better it would be for the public at large. Mr. J. Catling proposed "The Houses of Parliament," and after adverting to the Budget, contended that only licensed valuers should be allowed to value for probate. Mr. A. C. Morton, with whose name the toast was coupled, said that he never thought it a part of his duty as a Radical to abuse the members of the House of Lords as citizens. In this respect, no doubt, they were very much the same as other people. With regard to the House of Commons, it had been seen at its worst during the last few days. He generally agreed with Mr. Catling's contention, and would support it in Parliament if he had the oppor-

tunity. The other toasts were "The Legal Profession," "Kindred Institutions and Associations," "The Vice-Presidents and Council," "Our Guests and Visitors" and "The Press."

ENGINEERING IN EDINBURGH.

At the last meeting of the Edinburgh Water Trust a report was read from the works committee recommending that Mr. James Wilson, of the firm of J. & A. Leslie & Reid, be appointed engineer to the Trust at a salary of 400*l.* per annum, with a commission of 2½ per cent. on the cost of new works, the engineer to have the assistance of the superintendent of works in carrying out the duties imposed upon him.

Mr. Archibald said the committee had gone into the whole question very carefully, and they found that the arrangement hitherto had worked very successfully and economically. In addition to the salary of 400*l.* paid to the late engineers, they had received on an average for the last twelve years a sum of 152*l.* 5*s.* 8*d.* For that remuneration they had to keep an office and an efficient staff of engineers, and he did not think they would get a resident engineer who would devote all his time to the Trust for less than 1,000*l.* or 1,200*l.* Another matter which weighed with the committee was that the surveys for new works which might be gone on with were in the hands of the firm to which Mr. Wilson belonged, and they thought it would not be advisable at the present time to make any radical change in their position. If they were to have a resident engineer the position of Mr. Coyne would have to be reconsidered, for it was very doubtful if the Trust would pay 1,000*l.* for a resident engineer and 500*l.* for a superintendent of works. They did not propose to make any difference in the position of Mr. Coyne, whose duties were to continue as at present.

Mr. Macpherson moved the disapproval of the report in order to obtain fuller information on the subject. It was open to question, he said, whether the engineer of a Trust like that should be a member of a private firm. He could say nothing against Mr. Wilson, but with the prospect of having an expenditure on new works of probably a million of money, the Trust should satisfy themselves that they were getting the very best available man.

The Lord Provost said the late Mr. Reid had told him shortly before his death that he had selected Mr. Wilson for his partner because he considered him the best available man in Scotland.

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

1a CRESCENT, MINORIES, LONDON, E.C.

Mr. M'Crae thought they were proceeding too hastily in this matter, and he favoured delay in order that they might have a further opportunity of considering the proposed terms and conditions of the appointment.

Mr. Cranston said he thought it could be proved that it would be as economical to give a large salary for a resident engineer as to carry out the proposed arrangement. If all the duties specified were to be carried out by the engineer, he held that the salary was quite inadequate; but his view was that when they considered salary, commission and fee for arbitrations, they would find that the Trust could afford to give from 1,500*l.* to 1,600*l.* for a first-class engineer to carry out all their works and surveys, and he had no doubt such a man could be got for a salary of 1,200*l.*

Mr. Cameron pressed upon the Trust the desirableness of having it clearly laid down, whoever was appointed engineer, that all papers and plans in connection with their works were the property of the Trust.

Mr. Colston, in the circumstances, advised the convener of the works committee to consent to delay for a fortnight, for he felt sure that the more members looked at the terms of the report, the more they would see that it was the best possible arrangement that could be made in the interests of the city.

It was agreed that the consideration of the report be delayed for a fortnight.

THE DRAINAGE OF CHICHESTER.

THE contractor for the drainage works at Chichester, Mr. Peters, has sent the following letter to the Town Council:—

"I trust you will excuse me troubling you, but I should like to point out to you and to the Council the great difficulties and expense I have met with owing to the great quantities of water encountered, far in excess of what was anticipated, I should think, by anyone. I would like to point out to you that the pumping and timbering left in the trenches in South-pallant has cost me about 60*l.*, and the timbering left in trenches in Orchard Street and other places, exclusive of above, has cost me 50*l.* The amount of water met with in the South-pallant would not in all probability have occurred had we not had to have gone the extra depth shown on plans. I am in the hands of the Council as to their decision of meeting me in this matter, and trust they will meet me as generously in this as in other matters where unforeseen difficulties have arisen."

The letter has been forwarded to the engineer for report. On the subject of another difficulty which has arisen the following report has been prepared by Mr. Baldwin Latham:—
Westminster Chambers, 13 Victoria Street,
Westminster: April 27, 1894.

Dear Sir,—In reply to your letter of the 14th inst. I have to report, for the information of the drainage committee and the Corporation of Chichester, that I have taken an opportunity of making careful inquiry into the matter referring to the sewer in New Park Road, and I regret to find that the complaint made by Mr. Butler with reference to the matter appears to have been perfectly justified, and as a consequence must have caused the sub-drainage committee considerable annoyance, which I very much regret, as I know how anxious your drainage committee are to see that the whole of the works are properly carried out. I may say that it is a very difficult matter to get works of this class carried out, even where the contractor and everybody else concerned is anxious that the work should be thoroughly done, as, unfortunately, many of the workmen are not fully alive to the importance of the avocation which they follow in jointing pipes, and "out of sight, out of mind" may be said of many of these persons. Of course the contractor is primarily responsible for all defective work, but it is his duty to employ such persons who will carry out the contract in the mode specified, and in this case it is required that the joints are to be made perfectly watertight. It appears that on the report of Mr. Balchin, one of the inspectors, the resident engineer caused the trenches to be filled in upon the application of the contractor, and as the water was rising rapidly at the time, the pipes were filled in before being tested. The test, when applied to these pipes, would have immediately discovered that they were defective in their jointing, and this would have involved the contractor in very considerable extra expense in having to make them watertight at a subsequent period, because not only does the contract require the contractor to use the water test as the pipes are laid, but when the works are completed the leakage is not to exceed in any length of sewer the amount stipulated in the contract when applied to any length. I consider it, however, a most grave dereliction of duty on the part of Balchin, who was the inspector responsible for the examination of these joints, that he did not examine them, but took the ganger's assurance that they had been properly laid. Therefore it appears to me that anyone who allows a long length of pipe, as in the present case, to be passed out of his hands

without examination is quite unfit to take charge of such important works, where so much depends upon the work being properly performed, especially in face of the fact that it does not appear that his word can be relied upon, as he has reported totally different to Mr. Prior to what he has reported to the committee and to myself. Under the circumstances I have advised Balchin to send in his resignation forthwith.—Faithfully yours,
BALDWIN LATHAM.

Mr. Edward Arnold, Town Clerk, Chichester.

The report is to be considered at to-day's meeting of the Council.

VANCOUVER.

A CORRESPONDENT of the *Times*, in an article on the prospects of British Columbia, says that Vancouver, the terminus of the Canadian Pacific Railway, and one of the termini of the Northern Pacific, furnishes an illustration of the magical change that can in modern times be quickly wrought by the application of capital and its ready handmaids, science and labour. Six years ago its site was entirely occupied by a dense forest of the magnificent pines and cedars of the Pacific coast; now it has nearly 20,000 inhabitants, enjoying all the comforts and most of the luxuries of civilisation. The signs of rapid growth are already disappearing; dynamite has blown out the stumps; fire has burnt up the wood; massive blocks of buildings are seen on all sides; the telephone is everywhere; electricity lights the streets, the hotels, even the private houses; it works the excellent tram system which connects Vancouver with the beautiful and flourishing town of New Westminster, ten miles away. The people, coming chiefly from eastern Canada and England, have retained their eastern and English habits. On Sunday the place has an aspect of quiet respectability like that of an English cathedral town. In spite of its rapid growth it has never known anything of the roughness of new towns across the border. The site of the city is admirable. A moderate elevation gives it an air of dignity; the eye looks down upon the broad and placid waters of the harbour, beyond which are noble ranges of mist-covered hills. Close at hand is Stanley Park, a splendid reservation of primeval forest, covering many hundred acres. Already intersected by pleasant walks and surrounded by a carriage-drive which winds along the cliffs and bays of the peninsula, giving wonderful panoramic glimpses of land and sea, the whole forms

a recreation-ground for this community, born but yesterday, that the proudest and most ancient capitals of Europe might envy. Vancouver is the meeting-place of the Empire's extreme west and east and south, for of the two main lines of steamships which frequent the port, one has its further terminus at Hong Kong, the other at Sydney. Their presence vindicates the policy which led Canada to make such sacrifices to secure a base upon the Pacific.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 8540. Richard Silverwood, for "Improvements in sliding sashes or windows."
- 8577. James Duckett, Son & James Duckett, for "Improvements in and relating to flushing apparatus for water-closets."
- 8693. George Harris Haywood, for "Improvements in ventilators."
- 8729. Arthur Lewin, for "Improved device for preventing the closing of the sashes of French windows."
- 8735. William Henry Palmer and William Gibson, for "An improved cowl or ventilator."
- 8749. Zotique Leroux, for "Improvements in windows."
- 8776. Robert Bolton, for "Improvements in the construction of chimney-pots."
- 8831. Henry Charles Foskett, for "Improvements in and connected with window fasteners."
- 8853. William Nichol, for "Improvements in and relating to window-sash and button-rod fastener."
- 8910. Julien Bouhon, for "Improvements in the construction of ventilators."

THE

Architect and Contract Reporter.**SPECIAL NOTICE TO THE TRADE AND OTHERS.**

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 209. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

TRURO.—May 31.—For Building Premises. Messrs. Henderson & Son, Architects, 31 Lemon Street, Truro.
 TYLORSTOWN.—June 2.—For Vicarage. Mr. E. M. B. Vaughan, Architect, Cardiff.

At the meeting of the Vestry of St. George's, Hanover Square, the rector (Rev. D. Anderson) brought up a report on behalf of himself and the churchwardens proposing to apply for a faculty to carry out certain alterations in the parish church, at an estimated cost of 3,000*l*. The alterations will include the removal of a gallery, the enlargement of the organ, and the reseating of the church in accordance with a plan prepared by Sir A. Blomfield.

TRADE NOTES.

IN reference to a paragraph that appeared in last week's issue of *The Architect*, Messrs. H. Parsons & Harris write to us that their radiators were selected for St. Bride's Institute, Bride Lane, E.C., but are being fixed by the contractors for the work.

MESSRS. R. WAYGOOD & CO. are now erecting suspended hydraulic passenger lifts as follows:—For Messrs. Harvey, Nicholls & Co., Knightsbridge; Gower House, Gower Street, W.; the Grocers' Hall, Princes Street; Messrs. S. & P. Erard, Great Marlborough Street; Messrs. L. Schwabe, Manchester; Corn and Produce Exchange, Manchester; Salvation Army, Queen Victoria Street; Kensington Hotel, for which they are also making several goods and luggage and dinner lifts. They are also erecting the following lifts and cranes, which are all designed to work on their patent water-saving principle. This system is a new departure, by which the water used by a lift or crane is apportioned to the load to be raised, a feature which has not been successfully accomplished hitherto:—Two suspended hydraulic goods lifts for the Army and Navy Stores, Westminster; suspended passenger lift for Mr. T. Joynson, Liverpool; suspended passenger lift for Moorgate Court, Moorgate Street, E.C.; two suspended goods lifts for Messrs. Falk, Stadelmann & Co., Farringdon Road; direct-acting passenger lift for London Commercial Sale Rooms, Mincing Lane; suspended passenger lift for Mr. John Phelps, Milk Street, E.C.; two hydraulic cranes for Messrs. Nicholls & Clark, Shoreditch, E.; one hydraulic crane for Messrs. Petty, Wood & Co., Southwark Bridge Road, S.E. They are also altering Messrs. Derry & Tom's passenger lift, and the passenger lift at the flats, 11 Portland Place, to work on this system.

MESSRS. HORNE, SON & EVERSFIELD have been instructed by the Commissioners of H.M. Works to sell by auction, in lots, on the premises, on Tuesday, May 29, at 12 o'clock precisely, the materials of the Albert Palace and Connaught Hall, comprising about 1,000 tons wrought and cast-iron, in girders, columns, principals, &c., all of which could be easily taken down and re-erected or made use of for smaller buildings, thus affording an exceptional opportunity of acquiring the costly ironwork used in the construction of concert halls, gymnasiums and other buildings at a comparatively small outlay; 1,000 feet iron railing, 16,000 feet of 4-inch and other flanged hot-water piping, 500 ornamental gratings, 1,100 squares capital flooring, with sound joists and timbers under, fittings

of lavatories, double and single flights of stairs, zinc, bricks, rolled and other glass, and the large variety of fixtures and fittings necessarily appurtenant to so large a building; also certain plaster casts and busts, pictures, and other unowned property.

WE notice that Mr. John Clark has just issued a repolishing and lacquering sheet, as he is now making a specialty of this work, having just completed the fitting up of a new department for the purpose.

THE Wolverhampton Town Council have accepted the tender of Messrs. Humphreys, London, for the erection of a temporary iron hospital.

THE contract for the erection of the new station at Haymarket, Edinburgh, by the North British Railway Company, has been obtained by Messrs. G. & R. Cousin, builders, Alloa.

THE *Norwich Mercury* says:—Two steamers arrived, wood laden, for Messrs. Jewson, Yarmouth. The *Maja*, from Memel, crossed the North Sea in three days, and arrived considerably sooner than she was expected. She brings between 600 and 700 loads of deals and timber. The *Danehill* brought 1,400 loads of deals, battens and boards from Soderhamn.

ELECTRICAL.

THE foundation-stone has just been laid of the new works now being erected by the Wolverhampton Corporation in Commercial Road, as head generating station for the supply of electric light for public lighting purposes in Wolverhampton. The necessary cables are now being laid down for supplying the light to a certain area, including the principal streets in the centre of the town. The initial cost of the head station works and plant is estimated at 30,000*l.*, Mr. A. P. Brevitt being architect, and Mr. H. Wilcock builder.

THE tender of Messrs. W. & J. Robinson has been accepted by the Bootle Town Council for electric-light installation at 3,224*l.*

AT the Foreign Office electrical engineers have been busy fixing the wires, &c., for the electric light to be installed on the occasion of the official celebration of the Queen's birthday.

THE Llandudno Town Commissioners have passed a resolution opposing a proposal to have the town lit by the electric light.

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London and Contractor.

147 STRAND, LONDON, W.C.

AFTER practical tests, a concession has been granted for working canal boats on the New York State canals by electricity.

AN electric-light supply has been installed at the Palace, New Brighton. The installation comprises a gas engine, which drives a 300 light dynamo coupled to a very elaborate switch-board, and two pumps, which throw 1,000 and 2,000 gallons per hour respectively, supplying the whole building with pure spring water.

BUILDING AND BUILDERS.

THE managers of the Aberdeen soup kitchen propose the erection of a new building on the site of the present kitchen in Loch Street, from designs by Messrs. William Henderson & Son. The estimated cost is a little over 1,000*l*.

THE Walsall School Board have adopted plans by Messrs. Bailey & McConnall for the erection of a cookery kitchen at an estimated cost of 1,320*l*.

EXTENSIVE covered tennis, racquet, fives courts, American bowling-alley, gymnasium (having tea-rooms over), laundry, &c., are being erected from the designs of Messrs. Darby & Salter at Cliveden, for the Hon. W. W. Astor. Messrs. Cooper & Sons, Maidenhead, are the builders.

THE improvement committee of the Sheffield Corporation have agreed to sell a site in Pinstone Street. The intending purchaser promoted the Empire Palace of Varieties Theatre in Birmingham, and a similar theatre in Edinburgh, and it is understood that it is his intention to erect a variety theatre for Sheffield.

THE Ayr Dean of Guild Court last year granted linings for new buildings and alterations of properties that were estimated to cost 68,000*l*. The dean stated that there were prospects of building for the coming year which would even exceed the past one.

A NEW police station is to be built at Reigate from the designs of Mr. F. D. Clark, borough surveyor.

THE Greenwich Board of Guardians instructed their architect, Mr. Dinwiddy, to examine and report upon the old system of drainage at the workhouse and advise upon its amendment. He has recommended the abolition of the old sewers and the construction of an entirely new system of drainage and sanitary fittings. The work will shortly be put in hand.

THE foundation-stone of the new Catholic church of St. Patrick, in Dudley Road, Birmingham, was laid on Wednesday, the 9th inst., by Dr. Ilsley, Bishop of Birmingham. The building, which is twelfth-century French, is being erected, at a cost of about 5,000*l*, from the designs of Messrs. Dempster & Heaton, architects and surveyors, of Grosvenor Chambers, Birmingham, Mr. John Bowen, of Baisall Heath, being the builder.

THE baths committee of the Liverpool City Council have decided to adopt the plans of the city surveyor for the erection of new salt-water baths at the pier-head, at an estimated cost of 50,000*l*.

IT is proposed to build a new church to meet the growing requirements of St. Alkmund's parish, Derby.

VARIETIES.

MR. RICHARD TANGYE is to receive the well-merited honour of knighthood in recognition of his munificent aid towards the Birmingham School of Art and Art Gallery, as well as for distinguished public services.

AN inquiry is to be held to-day (Friday) at Yarmouth with reference to the application of the Corporation for sanction to a loan of 3,000*l*. for sewerage works, and one of 1,500*l*. for street improvements.

THE Glasgow authorities have appointed Mr. Donald M'Coll, who has been assistant superintendent of cleansing in Glasgow for several years, superintendent at a salary of 450*l*., in place of Mr. John Young, the former superintendent, appointed to the management of the Corporation Tramways. His salary as cleansing superintendent was 800*l*.

THE Worthing Town Council have decided that application be made to the Local Government Board for sanction to borrow the following sums on security of the general district rates, funds and water rates of the borough, viz. 35,000*l*. for purchase of land, sinking well and other works in relation to the water supply; 26,500*l*. for purchase of the West Worthing Waterworks (including the land and works at Durrington), baths and premises, with the rights, powers and privileges of the company; and 650*l*. for widening and improving parts of Chapel Road, Richmond Road and Montague Street.

B. E. NIGHTINGALE, Builder & Contractor,

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

THE Commissioner of Works intends to beautify the site of the Old Law Courts to the north of Westminster Hall. Workmen are engaged laying out flower-beds among the grass similar to those in Parliament Square.

THE imposing structure in Argyle Street known as Hengler's Circus has passed into the hands of the Duval Restaurants Company. Externally the building will remain as it stands, but the interior has to undergo a complete process of transformation, and no expense will be spared to render the restaurant one of the best in London, both from an architectural and gastronomic point of view. Among those interested in the development of the Duval system in London are Prince Philip of Bourbon, the Duke de Morny, the Duke de Montmorency and the Duchess of La Roche-Guyon.

THE lumber manufactured annually in the Dominion of Canada amounts in round numbers to 2,000,000,000 feet, British measure, mostly pine. The Province of Quebec has been producing about 3,000,000 logs annually, furnishing 525,000,000 feet, B. M., of sawed lumber, principally for export. Ontario has made 7,000,000 logs annually for some time past, producing 700,000,000 feet, B. M. A large proportion of the above is shipped to the United States. In addition, Ontario yearly ships to the United States 250,000,000 feet, B. M., in saw logs.

THE borough surveyor of Wednesbury has just submitted his annual report. The total length of streets and roads in the borough is 20 miles 4 furlongs 17 yards. The main roads make up a length of $3\frac{1}{4}$ miles, and the total cost of maintaining these, exclusive of all expenditure in connection with the paving of footpaths, in the year ended March 31, 1893, was 981/18s. 11d., or 302/ per mile. The upper part of Ridding Lane was widened at a cost of 1,213/., and the footpaths of forty-five streets were paved out of the loan of 6,250/ obtained for this purpose. For street-watering purposes 16,347 van loads of the South Staffordshire Waterworks Company's water, representing about 4,250,220 gallons were used; and the expenditure upon manual labour in the several departments under the surveyor's control was 1,833/ 14s. 1½d., as against 1,716/ 3s. in the previous year. The total length of sewers in the borough at December 31 was about twenty-nine miles.

AN inquiry has been held with regard to an application made by the Upper Stour Valley Main Sewerage Board for permission to borrow 110,000/ to defray the cost of the sewerage scheme. It was stated that the total length of the sewers would be about twenty-five miles.

THE Dumbarton Harbour Board have sold their dredger *Leven* to the authorities at Newhaven for the sum of 13,500/.

When new, the vessel cost about 10,000/ more.

THE Pontypridd Local Board have decided to purchase the property of the Markets and Town Halls Company for 31,000/.

THE North-Eastern Railway Company intend to provide additional quay accommodation at West Hartlepool for the timber traffic.

THE design by Mr. S. J. Wilde, architect, submitted by Mr. W. E. Perrett, for the Pigott memorial clock tower to be erected on the sea-front at Weston-super-Mare, was finally selected out of about fifteen sent in.

THE Grays Local Board are about to borrow 6,000/ for sewerage works.

WATERHEAD BATHS, OLDHAM.

THIS building, just opened, is situate on the corner of a plot of land abutting on Cedar Street on the front and Mortar Street on the side, the superintendent's house being placed at the angle of the two streets, having lobby, sitting-room, kitchen and scullery on ground floor, three bedrooms, also cellar. In the centre of the block is ticket-office, well lighted with a large electric-headed bay window. This room is well fitted up with drawers, cupboards for storage of towels, &c. On each side of this room are the male and female entrance corridors, fitted with swing doors, having upper panels glazed with lead lights and separated from ticket-office by glazed screens, with pay-window and registering turnstiles to each, a gate being provided to turnstiles for use of officials, &c. Behind here there is a cross corridor, which leads on the left to twelve male slipper-baths, and on the right to six female slipper-baths, there being a separate waiting-room provided for each sex.

The whole of the slipper-baths are porcelain, glazed both inside and outside, having no wood-framing round whatever. This system is the most sanitary arrangement, as it allows the attendant to have thorough supervision, so that it would be impossible for the slightest dirt to accumulate without his knowledge. Five of the slipper-baths will be used as first-class baths, having showers and other advantages over the remainder. The supply of hot and cold water to the baths is regulated by means of valves worked by a detachable handle by an attendant in the corridors.

From the cross corridor the plunge-bath is reached, the

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON).—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

HEWETSONS, TOTTENHAM COURT RD., LONDON, W.

440.—English Carved Oak Writing Table, Leather Top, on Casters. £15 10s.

Without Drawer and Pigeon-holes on Top, £10 10s.

dimensions of this room being 74 feet by 46 feet, with a water area of 60 feet by 26 feet, the depth being 6 feet 6 inches at one end and 3 feet 6 inches at the other. The bottom is tiled with black and white tiles, formed in panels, the sides being faced with white glazed bricks. A diving platform is provided at the deep end of the bath. Round the gangways are ranged forty-two dressing-boxes, there also being the necessary foot-bath, shower, water-closets, urinals, &c. Six Stott-Thorp pendants, with ornamental wrought-iron scrolls, are provided. The entrances to this bath are so arranged that it can be used by either sex without interfering with private bath corridors.

At the rear of the premises are the laundry and boiler-house, the former being fitted up with all modern requisites, consisting of patent steam-power washing-machine, also rinsing tank with wringer having rollers of vulcanised indiarubber, wringing and mangling machine, drying chamber containing six drying-horses. Four washing-troughs all fed with steam, hot and cold supply, the whole of machinery being worked by steam-power by means of a vertical steam-engine and shafting driven with belting. A two-flued boiler, 15 feet by 6 feet 6 inches, made by the Oldham Boiler Works Company, supplies steam for the whole of the system throughout.

The floors to the whole of baths and corridors are of steel joists, and finished with granite-faced concrete, being plentifully supplied with channels and grids to convey away surplus water.

The baths and corridors have dadoes of white glazed bricks with ornamental bands at top. The whole of the premises are efficiently heated by steam.

The continuous lantern-lights both over plunge and private baths are made to open from end to end for ventilation by means of cranked levers, &c., worked by attendant from the floor.

The whole of the building work has been carried out by Mr. William Lees, the sub-contractors being—excavating, concreting and brickwork, Messrs. S. & J. Smethurst; masonry, Mr. J. Bebbington; steel joists, &c., Mr. Edward Wood, Manchester; wrought ironwork, Mr. J. Kershaw; slating, Mr. Joseph Jackson; plumbing, glazing and painting, Messrs. Harker Bros., and plastering, Mr. David Rothwell.

The whole of the steam, hydraulic and engineering arrangements throughout have been carried out by Mr. W. F. Spencer, Crossbank Works, Oldham, the whole having been executed according to the plans and under the supervision of Mr. Charles T. Taylor, A.R.I.B.A., architect, 10 Clegg Street, Oldham.

BIRMINGHAM GAS UNDERTAKING.

At the meeting of the Birmingham City Council on Tuesday Alderman Pollack brought up the report of the gas committee, and moved that the Council authorise the appropriation of 24,551*l.* 15*s* 9*d.*, being the net profit of the gas department for the year ending March 31 last, to the credit of the improvement rate of 1893. He pointed out that there were three important factors in the accounts of the gas department during the year—the coal strike, the decrease in the consumption of gas, and the increase in price. In December last he estimated the additional purchases of coal rendered necessary by the strike at 24,000*l.* This had been reduced to 15,000*l.*, an economy of 8,000*l.* having been effected by reselling the coal practically at the pit as soon as the ordinary contractors had resumed delivery. The estimated saving of coal referred to in the last annual report had also been carried out, otherwise the unfavourable trading of 1892-93 would in itself have necessitated an increase in the price of gas. The advantage thus gained, however, had been entirely lost through the strike. In 1888 they paid for coal 162,000*l.* for an output of 3,500 million cubic feet of gas; in the year 1893-94 their coal cost them 261,000*l.*, or 62 per cent. more, while the output of gas was 4,000 million feet, or only 14 per cent. more. But while the price of coal had gone up until it was even now 50 per cent. higher than in 1888, during the whole of that time the committee had not altered the price of gas. At last they were obliged to increase the price, but notwithstanding this the revenue from gas consumption for the year just ended only showed an increase of 5,858*l.*, notwithstanding that the increased price came into force during the heaviest quarter of the year. For the first time, in fact, since

the acquisition of the gas undertaking their revenue from gas had been affected by a decrease in the consumption. Discussing this matter in its bearing on the future of the gas undertaking, Alderman Pollack said that the total decrease of consumption last year, taking into account the additional consumption which might have been expected from the increase in the number of court and public lamps, was 100 million cubic feet, or 2 per cent. But taking into account that until quite lately there had been an average annual increase of 4 per cent., this really meant a loss to the department of 6 per cent. on the sale of gas. In the previous year the consumption was stationary, so that the sale two years before actually exceeded by 56 millions that of last year, although the department now supplied the whole of Sutton Coldfield. Was this reduction peculiar to Birmingham, and was it likely to be permanent? In London the Commercial Gas Company reported a decrease of 4 per cent., and the South Metropolitan one of 1½ per cent., while decreases of from 2 to 4 per cent. were reported from the following among other places:—Brentford, the Crystal Palace, Bradford, Bristol, Sheffield, Leicester, Derby and Dublin. In Paris the decrease was 1½ per cent., and the loss of profit 226,000l. The reasons given were everywhere the same—exceptionally light weather, bad trade, the introduction of the electric light, and the adoption of economical gas appliances. The hours of sunshine registered in Birmingham during the year just passed exceeded by 463 those in the previous year, and in the months in which the increases were shown there was a considerable falling off in the consumption of gas. March this year showed a reduction in the hours of sunshine as compared with March of last year, and the reduction in the consumption was consequently only two-thirds per cent., as compared with a reduction of 4 per cent. in the December quarter, when the hours of sunshine showed an increase. With regard to the question of bad trade, St. Mary's, St. Bartholomew's, St. Thomas's, St. Stephen's, St. George's, Ladywood and Duddeston Wards, the manufacturing portions of the city, showed a decrease in the consumption of from 4 to 7½ per cent.; St. Paul's and Deritend Wards, one of 3 per cent.; and Bordesley, Harborne, Nechells and St. Martin's a decrease of less than 1 per cent. There was an increase of from ½ to 5 per cent. in the outlying wards, attributed to new buildings, while in Edgbaston, where the grumblers resided, there was an unaccountable decrease of 7½ per cent., and in Market Hall Ward one of 6·2·3 per cent., no doubt mainly due to the use of electricity. Dealing with

the effect of the competition of the electric light, Alderman Pollack said that in the year ended March 31, 1891, the department supplied to the Town Hall 23½ million cubic feet of gas, to the Post Office 6½ millions, and to the other consumers in the present electric-lighting area 303 millions, making a total of 332½ millions. In the year ended March 1892, the consumption in the area was:—Town Hall, 955,000; Post Office, three millions; other consumers, 339 millions; total, 343 millions. In the year ended March 1893, it was:—Town Hall, 372,600; Post Office, 1½ millions; other consumers, 334 millions; total, 335½ millions. In the year just ended it was:—Town Hall, 358,800; Post Office, 1,284,100; other consumers, 310 millions; total, 311½ millions, so that while the total consumption for the area showed in 1892-93 an increase of 3½ per cent., there were decreases in the last two years of 2·1·7 and 7½ per cent. respectively. It was, therefore, evident to everyone that the competition of the electric light was seriously checking the consumption of gas. As to the fourth reason, it was one which had in the past, and would in the future, still further reduce the consumption. The gas department had always endeavoured to promote the use of gas-saving appliances, believing that a lavish and improvident use of gas was of no advantage to the undertaking. Great strides had been made in the construction of economical gas-burners, especially during the last few years in connection with incandescent burners. In a recent estimate the committee had calculated that by the use of such burners a saving of 50 per cent. could be effected. The question whether the reduction in the consumption of gas in the city was likely to be permanent was not easily answered, but it was important because the committee were constantly providing enlargements of mains and extensions of plant, and it might be prudent to stay their hands in both respects if they abandoned the hope of a continuous increase in the output. They would be very sanguine if they anticipated the phenomenal weather of the last two years; in fact, there had already been a change this year for April and May favourable to the consumption of gas. Trade, unfortunately, was not mending, but it would be contrary to precedent if the present stagnation proved to be permanent, and it was to be hoped that the educational advantages the city was providing for the workers of Birmingham would enable the manufacturers to withstand the tide of competition. On the other hand, it appeared likely that the working of overtime would be abandoned to a great extent, and that would necessarily

affect the consumption of gas. There was, however, the fact that the improvements in the construction of gas-stoves and gas-engines had led and were leading to an increase in their use. But it would be idle to deny that the application of electricity to illumination would grow. Taking all these conflicting elements into account he had come to the conclusion that they would no longer see their output take these great strides by which it had risen within eighteen years from 2,300 millions for a larger area, including Smethwick, West Bromwich, Tipton, and other districts which now supplied themselves, to 4,000 millions for the present more contracted area, but that there would still be a gradual though slower increase, mainly governed by the state of the weather and trade, and that it behoved them to be prepared for the reasonable maximum output of gas foreshadowed by the extensions in their plant which the committee had reported from time to time. Except from this drawback of the decreased sale of gas, the accounts had been on the whole satisfactory. The profits from residuals, for instance, had exceeded their most sanguine expectations. They could not, however, have made the contribution to the improvement rate spoken of in the resolution without the higher revenue from gas during the last three months of the financial year due to the increased price. No doubt the Council would be anxious to know how long this increase was to last. All he could say on behalf of the gas committee was, "not one day longer than is absolutely needed." For the last three or four years when coal had risen, when expenditure for wages and purification had vastly increased, when almost every gas undertaking in the kingdom had raised its price, the Birmingham gas committee stood by their old charges for gas until it was impossible to do so any longer. Their anxiety to revert to the old price was no less than it was a year ago. No one was more alive than they were to the advantages of cheap gas in the face of so many competing elements. But it was their duty to present to the Council a clean balance-sheet. The Council would not wish them to follow the example of other gas undertakings in showing a deficit to be carried forward and to be made good by drawing upon their reserve, and so long as the coal market remained in the present unsettled condition, and they were unable to forecast with any degree of certainty their expenditure for coal or their revenue from coke, they must ask the Council to forbear and wait with patience, trusting the Council to take a broad view of the situation, and to act alike in the interest of gas-consumers and ratepayers.

The motion was agreed to.

THE CHICAGO EXHIBITION.

AN exhaustive report of the Royal Commission for the Chicago Exhibition appears in the *Journal of the Society of Arts* for the 18th inst. The following are the commissioners' conclusions on the subject:—

Those who did not visit Chicago cannot understand the enthusiasm which was aroused by the exhibition or credit its genuine character. The exaggerated laudation of the newspapers produced a natural tendency to disbelief; yet, when every allowance is made, it remains a fact that the people of Chicago did produce a display unequalled in many characteristics and in many respects distinctly superior to any previous similar attempt.

The Chicago Exhibition was not merely the largest, but it was certainly the most magnificent exhibition since the first of all exhibitions in 1851. Criticism of many shortcomings would be easy enough, but, after all faults had been found, it is not to be denied that this great undertaking was courageous in its inception, splendid in its execution and successful in its result.

In Europe it was certainly not appreciated at its proper value. The interest which had been aroused by the first announcement of the exhibition and by the preparations for it seemed to fall dead after the opening. Part of this was, no doubt, due to the incomplete condition of things when the exhibition was opened. The buildings themselves were not entirely complete, and in many parts of them the installation of the exhibits had hardly commenced by May 1.

Many English newspapers had sent over representatives to be present at the opening. The reports sent by these gentlemen were of necessity unsatisfactory, and the impression thus created prevailed over the whole duration of the exhibition. Then, too, it must be remembered that all information about American matters comes to Europe from the Eastern States, and they, at first hostile, were never very friendly disposed towards Chicago and its fair.

Thus it came about that the value of much of the energetic work which had been done by the promoters of the fair in advertising it before it was opened was practically lost.

The exhibition was, indeed, fully appreciated in America—at all events, in Western America. The people, not only of Chicago but of Illinois and the neighbouring States, were justifiably proud of their achievement, nor did they hesitate to give full expression to their sentiments in every manner available.

NOTICE.

Mr. JOHN GRUNDY has purchased the whole of the Valuable Stock and Patents of The Helios and Calorifer Stoves from Mr. H. HEIM, of Vienna and Oxford Street, London, W.

The Premises 95 and 97 Oxford Street will be open until June 24, and Architects and Builders are invited to call, as the stock, which is a very valuable one, will be sold at greatly reduced rates.

In all the earlier exhibitions the exhibits themselves were held to be the sole, or almost the sole, attraction; it was sufficient if the buildings furnished suitable shelter and were not unsightly in themselves. At Chicago the great feature was the unique arrangement of the frame of the picture. In all comments upon the exhibition it was the general effect, the splendour of the buildings, the beauty of the situation, which was remarked upon, not the importance or the beauty of the exhibits and the evidence they afforded of industrial or scientific progress.

It was at Paris that this idea was first developed to any extent; at Chicago it was carried almost into excess. Enormous sums were lavished on splendid, but temporary, palaces and pavilions, not by any means particularly well adapted for their ostensible purpose, but impressive and magnificent in appearance, singly or in conjunction with the rest.

Hardly any one of the Chicago buildings—except, indeed, the Fine Arts—was suitable for exhibition purposes. The great Manufactures Building dwarfed the exhibits within it, and was dwarfed by the great structures set up inside it. There was nothing like the fine range of galleries in which the French industrial exhibits were shown in Paris in 1889, galleries than which no buildings could be better adapted for their special object.

Nor does this criticism apply to the great exhibition buildings alone. The numerous and costly pavilions set up by the different States of the Union followed the same intention. As a means of illustrating the natural or manufactured products of the States, these buildings were useless; nevertheless, they satisfied the feeling of State patriotism, and were greatly admired, each by the citizens of the State it represented. The rivalry between the different components of the great American Union is very keen, and it was shown in Chicago by the anxiety of each State to outdo its neighbour in the appearance and character of its building.

The same feeling, too, governed the character of the interior fittings and decorations. The rivalry between the different countries seemed to be—not who could show the finest goods, the newest machinery, the most important invention, but who could erect the most attractive and elaborate structure. It was the manner of showing the goods, not the merit of the goods themselves, which was considered; hence those countries had an advantage in which the Government was the principal or the sole exhibitor, not those who relied upon individual manufacturers. In the former case the exhibit of a country could be

treated as a unit. In the latter, uniform treatment was, at all events, difficult.

A lesson may certainly be learned for guidance in the administration of future exhibitions. If it is desired to make an imposing display it must be done by the subordination of the individual exhibitor to the general effect. Inasmuch as this is not to the advantage of the individual, though it is best for the country in general, it is doubtful whether English exhibitors will ever agree to such a system; but if they do not they must be content to see public attention attracted by the better organisation of their rivals.

This of course means a considerable expenditure by the Government, and a reduction of the cost to the exhibitors. It is certain that a more effective display might have been made by this country at Chicago if a portion of the money spent by the exhibitors had been paid into a central fund and expended under their supervision for the common benefit of the section. Whether this would have been more or less advantageous to the individual manufacturers who exhibited is another question. At all events, it is to be remembered that an exhibiting firm advertises not only its own wares but the wares of the country it represents, and English trade as a whole benefits from the exertions of the few of its representatives at a foreign exhibition. Probably in the long run more advantage would be gained if the several trades would recognise this fact, and would see that it is their duty to exhibit collectively. The rivalry one against another ought to be forgotten for the moment or merged in a general effort to compete successfully with the representatives of other countries.

Another great feature of the Chicago Exhibition was the extent to which amusement was provided for the visitors. Here, again, was an elaboration of Paris. In the older exhibitions the exhibits formed the attraction; now people have to be attracted to see them by every means. This system was no doubt commenced in the South Kensington Exhibitions, where first electric light was used for exhibition purposes and evening opening became possible. It was carried to a much larger extent at Paris, and received its full development at Chicago. There the title of "World's Fair" was fully justified. The large area of the exhibition given up to the purposes of amusement resembled nothing so much as a gigantic fair; every country on the globe contributed something; there were sights and shows of every sort from everywhere. Still it would not be fair to attribute the great crowds who visited the exhibition simply to the amusing side of it, for though the Midway

P. A. GILBERT WOOD, 175 Strand, W.C.

Plaisance was the most crowded part of the exhibition, the picture galleries were always full, and so were the Manufactures and the other main buildings.

The final question of an exhibition, as it is the first which is asked when the idea of an exhibition is set on foot, is as to the advantage to be gained by it. Of the advantage to Chicago, and, indeed, to the Western States of America, there can be little doubt. Chicago desired advertisement, and she had it; the name of that city is known now all over Europe, in quarters where two years ago it had hardly been heard of. Whether there is any genuine profit to be made out of this remains to be seen. In the matter of actual pecuniary profit, it is probable that Chicago gained a good deal. The city and the inhabitants subscribed, perhaps, 8,000,000 dollars; but much more than this sum must have been brought in by the foreigners and the visitors from distant parts of the country.

And the great bulk of visitors profited, if not in money at all events in knowledge and education. To the laborious people of the Western wheatfields, familiar with what surely seems to us the dullest and dreariest form of human existence, absolutely ignorant of the arts and luxuries of life, the exhibition was a revelation. No such opportunity had ever been offered the people of the Western States of seeing the latest results of civilisation; what had been done by science for the amelioration of human life; what had been done by art for its adornment. They availed themselves of the opportunity to the full. They came in thousands, ready to profit by all they could see, and the lessons which they took back to their Western homes will certainly not be without an abiding effect on the future of American civilisation.

To foreigners, on the other hand, it is a more important consideration whether they gain any material advantage from an international exhibition such as that just concluded at Chicago. That if one of the great trading nations of the world takes part in an exhibition, the others must do so is a foregone conclusion. It is certain that had we not taken a prominent part at Chicago the result would have been disastrous to our trade. But we had less to gain than any of our rivals. The problem for British commerce is to hold what we have gained. The problem for that of other countries is how best to obtain a share of what we now hold.

In a protectionist country an international exhibition is something of an anomaly, but that is all the more reason that those who profit by free trade should avail themselves of the opportunity to read the protectionists a lesson. It can hardly

be doubted that the evidence afforded at Chicago of the vastly cheaper rates at which many classes of goods could be obtained were they imported instead of being produced in the country made a profound impression on many shrewd observers. From this one cause alone we may expect considerable advantage to our trade.

That so small a number of foreigners visited the exhibition was a disadvantage to us. Our exhibitors were able to appeal only to the American public, not, as was reasonably expected, to a public gathered from all parts of the world. Yet, even then, it must be remembered that the United States, spite of tariffs, remains England's best customer among foreign nations, and that it is far more important for us to stand well in her markets than in the markets of any other country. Hence it may be taken for certain that we were well advised in making the efforts which were made to stand well at Chicago, and we may feel assured that those efforts will not be without useful practical results. It may be added that we should have been wiser still had our manufacturers been less inclined to dread the effects of protectionist tariffs, and if a larger number had come forward to take their share in maintaining the position we have taken on so many previous similar occasions.

The rivalry at Chicago was keener than ever before. Never have our manufacturers had to meet competition so powerful and so well organised. But if the task was more difficult, its accomplishment may be considered as the more satisfactory, and, as it may be hoped, so may it reasonably be expected, that the care expended and the expense undertaken by so many of our leading manufacturers may not be without their due reward, both to the individual competitors and in their wider results on the trade and commerce of the country.

THE Ashbourne Local Board have let a contract, amounting to 140l., to Messrs. Smith & Taylor, of Ashbourne, for sinking a 10-feet well through the clay a depth of 55 feet. Further contracts will have to be let for sinking a well through the sand-rock below this depth. It is expected that a supply of water will be obtained from the Bunter sandstone at a probable depth of over 150 feet. It was originally proposed to take water from the Sturston spring, but the idea was given up in consequence of land-owners' opposition, and because Professor Boyd-Dawkins, the geologist, advised that the water could be obtained nearer the town. The engineer to the scheme is Mr. W. H. Radford, C.E., of Nottingham.

TRADE MARK

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING any proposed or existing building. All difficulty in the employment or transmission of power to any part of a Building, where ever electric current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

WALL INLET VENTILATOR

WITH INDICATORS

(DARRAH'S PATENT).

Incorrect Indication Impossible. Only One Action.

In the above we have introduced a most important improvement. It consists of an Enamelled Indicator, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

BAXENDALE & CO.,

Miller Street, Manchester, and Hanover Street, Edinburgh.

MASONS AND BRICKLAYERS IN ITALY.

THE masons and bricklayers (*muratori*) of Italy have established several co-operative societies or associations. They differ in one essential principle from other bodies of workmen since they cannot produce irrespective of the demand for their goods, but are obliged to work to order. The published list includes forty-three masons' co-operative societies, of which thirty-one are legally recognised, eleven are unrecognised and one is affiliated to a benevolent society. The Fourth Congress of Italian Co-operators mentions in addition a society which was about to be formed at Forlì to defend the masons against the intrigues of contractors.

All the masons' societies have a capital formed by means of shares payable by instalments. Some admit only working members (masons and operatives of kindred trades); others have both working and non-working members; others, again, take a middle course, and admit as members workmen and co-operative and other societies, but no private individuals who are not labourers. The object of these societies is to contract for work to be carried out by the members. Generally, however, they also employ extra hands, who are paid like ordinary workmen. The members receive wages and a share in the profits.

The societies of Imola, Milan and Cesena represent three typical forms of masons' associations. From the co-operative point of view the best type seems to be that of the Imola Society. Only workmen are admitted. The members are effective and co-operating. In the first class are entered the founders and those co-operating members who have reached the age of twenty-one, and have belonged to the Society for three consecutive years. The second class comprises those who have been members for three years and are eighteen years old. A new member is not formally bound to the Society during his first year. No member may possess more than fifty shares. The shareholders receive a dividend of 20 per cent. upon the annual profits if this does not exceed 6 per cent. on the paid-up capital. The remainder is divided in the following proportions—75 per cent. in equal parts to the effective and co-operating members respectively, the master masons to have twice as much as the journeymen, 20 per cent. to the benefit fund and 5 per cent. to the reserve fund. Sick members are not to lose their right to share in the profits, provided that their illness does not last more than three months. No member may undertake work independently of the association.

At Cesena there are two kinds of shares—those subscribed for by working members (masons, smiths, carpenters, stone-cutters, glaziers, varnishers, day labourers), and those subscribed for by any other class of persons. One-half of the profits is divided among the shareholders who fall under these two categories, but not more than 5 per cent. may be paid on shares of the second kind; the other half of the profits goes to the reserve fund and to the benefit fund. This Society has been accused of a tendency to become an association of capitalists. It has certainly lost sight of the true co-operative principle of employing only its members, and relies largely on independent hired labour.

Only working members are admitted to the Masons' Society at Mantua. No member may hold more than five shares. The shareholders have half the profits; the remainder is paid to the members in proportion to the amount of work done by them. With the exception of the Imola Society, this is the most strictly co-operative of all the masons' associations in Italy. Sir D. Colnaghi mentions that in 1891 it had obtained some contracts from the military authorities.

At Bologna, owing to a defalcation of funds, the Masons' Association encountered difficulties, which it was gradually overcoming when the Foreign Office Report for 1893 was published. The municipality has been able to give the Society several contracts which have been satisfactorily carried out. As the Society has no present capital, however, it labours under certain disadvantages, such as having to pay interest on materials and to hire barrows.

This Association sprang out of a Society which was formed at the end of 1884 by the Bolognese masons in opposition to the middlemen (*imprenditori*). In 1888 this passive resistance took the active form of a co-operative society of production with 400 members and a capital of 12,000 lire, divided into shares of 25 lire and upwards. In the first year of its existence the Association undertook work to the value of 5,200 lire, and by 1890 it held contracts amounting to 180,000 lire.

The report of the Fourth Congress of Italian Co-operators blames the Roman Masons' Society for borrowing money from Government and for involving itself in debt by undertaking work in Greece which it could not carry out. A Government loan of 50,000 lire alone seems to have saved this Association from bankruptcy, and it was regarded as a suspicious circumstance that during the ensuing elections it published a manifesto in favour of the Government candidate.

The Masons' Society at Leghorn was founded in 1889. In

	SILVER MEDAL—PARIS, 1889.

1890 it held contracts for work to the value of 30,000 lire. It paid 40 centimes per hour to the master masons (*muratori*) and 25 centimes per hour to the journeymen (*manovali*). The president received 4 lire per diem, exclusive of holidays.

Co-operative masons' societies have also been started at Venice, where the capital amounts to 27,000 lire; at Parma, where 87 members formed an association in December 1889, and among the builders (*costruttori*) of Padua and the labourers (*braccianti*) of Pisa, who are employed on embankments and in factory building.

The most prosperous of all the associations mentioned by Signor Bodio and by the co-operators' reports is the Masons' Society of Milan, which was founded in 1887, when the Milanese masons were preparing for a strike. This Society distributes its profits on a somewhat elaborate system. It gives 20 per cent. to the reserve fund, 60 per cent. to the shareholders, 14 per cent. to the old age fund, 3 per cent. to assistant workmen, and 3 per cent. to the managers (*amministratori*). The ordinary workmen are completely excluded, and this is the more significant because any one may be a shareholder, and the number of shares held by each member is only limited by the provisions of the Commercial Code.

The Second Congress of Italian Co-operators, held at Milan in 1888, saw the solemn inauguration of the Milanese Masons' Society. In one year this Society executed commissions to the value of 133,000 lire. It was employed by the municipality of Milan on works connected with the new communal cemetery at Musocco, and appears to have carried out its contract punctually and honourably and without disputes. By August 31, 1890, it had executed contracts for work to the value of about half a million lire, giving employment to 150 or 200 members, and its capital amounted to 990 shares of 25 lire and upwards. It was then thinking of forming a fund for infirm members, and with the help of the Savings' Bank of building a co-operative lodging-house for masons who came to Milan.

In 1893 Sir D. Colnaghi stated that the Society had 500 members, with a capital of 27,000 lire, nearly all paid up, and divided into 1,100 shares. The reserve fund amounted to 15,000 lire, and the provident fund to nearly 10,000 lire. It only remains to mention a new departure made by the Milanese masons soon after the foundation of their Society. They bought a plot of land, on which the members of the association built a house, giving up their Sundays for this purpose. Instead of receiving wages for their work the men were paid by a bond, which could

be exchanged for shares in the Society, and thus, without any expense save that of the raw material, the association found itself in possession of a fine building.

"As we cross the Lombard plains," writes Signor Romussi in his report on the progress of Italian co-operation in the year 1887-88, "we see rising up before us the ancient *campanile* erected, stone by stone, by the Sunday labour of the peasants; these are the witnesses of their faith; the house built by the masons of Milan will bear witness to the new faith of the insignificant 'masses,' who, by unity of action and force of will, have become the authors of their own redemption."

CATHEDRAL DIGNITARIES AND BUILDERS IN NEW SOUTH WALES.

AN application has been made in the Equity Court, New South Wales, on behalf of the Right Rev. George H. Stanton (Bishop of Newcastle) and the Very Rev. Arthur E. Selwyn (Dean of Newcastle) for the continuance of an interim injunction to the hearing to restrain an action at law by John Straub, builder, against them. The statement of claim sets forth that the plaintiffs represented the building committee of the Newcastle Cathedral. One of the defendants, Horbury Hunt (president of the Institute of Architects of New South Wales), had been employed as architect for building the cathedral; and the other, John Straub, was the contractor for the building of the walls of the cathedral, the contract price being 14,853*l*. Some dispute arose about the kind of bricks supplied, it being alleged that they were not in conformity with the contract. Notice was given by the committee to the contractor that the bricks would have to be of the required description. Subsequently the committee gave notice to the architect asking him to certify when 8,000*l*. had been expended, in order that the committee might direct the suspension of the work, a clause in the contract providing for this being done. Mr. Hunt gave the certificate, but in it stated that the contractor was entitled to the sum of 9,262*l*. The sum said to be due beyond what had been paid by the progress certificates (representing 5,500*l*.) was 3,762*l*. In consideration of receiving this 3,762*l*., the contractor agreed to suspend the contract. The committee held that 9,262*l*. was an excessive overcharge, and were advised that the proper amount could not exceed 6,000*l*. The committee further alleged that Mr. Hunt was "so biased by his anger at the opposition of the committee to his wishes

ESTABLISHED 1860.

and views that he had not *bona fide* exercised his judgment in signing the certificate." Mr. Straub had since commenced a common law action to recover the 3,762*l.* The motion now before the Court was to continue till the hearing of the equity suit the interim injunction restraining the common law action.

Mr. Justice Owen, the chief judge in equity, said this was an interlocutory application for an injunction to restrain the defendant, John Straub, from proceeding with an action at law against the building committee of the Anglican cathedral at Newcastle. The defendant Straub was the contractor for the building, and he was suing the members of the building committee for the sum of 3,762*l.*, which was the amount certified by Mr. Horbury Hunt, the architect of the building, as at present due to the contractor. The case which was made in the pleadings by the plaintiffs in this equity suit was that the defendant, Horbury Hunt, was unfit to exercise the duties of architect in an impartial and unbiassed manner, and that he had been guilty practically of fraud in charging a much larger amount to the building committee than the amount actually due to Straub, and that his professional vanity had been hurt by not having had the honour and distinction of finishing such a building, and that out of anger and spite he had increased the certificate by a very large amount, and that therefore the Equity Court ought to interfere and restrain the defendant Straub from suing on that certificate, and that the Court itself should take the account and see how much was due for the work done. The charge of bias in the pleadings in the Equity Court appeared to him to be a ground which the defendants in the action at law could plead as against the certificate. He could see no reason why misconduct and incapacity of the person selected as the supreme arbitrator in all matters connected with the contract should not be pleaded just as much in the Court of Common Law as in the Court of Equity. But further than that, the plaintiffs distinctly pleaded collusion between the architect and the contractor, for they made out that the defendant Straub was well aware that the certificate had been given *mala fide*. Unquestionably that was a good plea at law, and that was the very plea which the defendants had set up in the action at law. That being so, there was no reason for the plaintiffs coming into the Equity Court to stay proceedings at law. There was no doubt that at an early stage it was open to either party to have sought the jurisdiction of the Equity Court; but the defendants had proceeded at law, and if the Court of Equity saw that the transaction could be fully dealt

with in the court of law, the Court of Equity would never interfere. Further, in the present case there had been a distinct charge of fraud, not only against the contractor but against Mr. Horbury Hunt, and it appeared to the Court that the Court ought not merely to deal with this case on a question of pleading where a charge of that kind had been made, but that the Court ought to express its opinion of the merits as disclosed in the affidavits. Whatever might be said on the arguments that Mr. Hunt had acted improperly under feelings of irritation and anger, the question for the Court was, What were the facts which had been proved? Mr. Hunt had produced affidavits by eleven architects and contractors, all of them men of high standing and experience—Mr. Mansfield, Mr. Rowe, Mr. Wardell and others—and every one of them said that the certificate was absolutely fair. No doubt some of them had made their calculations from seeing the contract itself and the photographs, and working the thing out not on the spot; but others had visited the spot itself, and the whole of those eleven witnesses swore that the certificate given by Mr. Hunt for the work was perfectly fair and perfectly justified. Against that there was only the evidence of one contractor in Newcastle, who had, no doubt, given his evidence fairly and *bona fide*; but it appeared to the Court that it was a question of judgment, and it was quite possible for a man to make an estimate very much lower than another, both acting perfectly *bona fide*; but when it came to be a question of whether Mr. Hunt had fraudulently made out the certificate or that he had given it from a sort of bias or hostility to the committee, then it appeared to the Court most important to ascertain what were the views of other thoroughly competent men as to the certificate; and they all said it was perfectly fair and just. It was to be borne in mind that that was not the final certificate. It was simply a progress certificate, and according to the evidence, and the law as laid down by the Privy Council, these progress certificates were nothing more than advance notes, and were subject to adjustment from time to time, either upon the issue of another progress certificate or upon the issue of the final certificate. The certificate given by Mr. Hunt was merely a progress certificate, and did not purport to be absolutely correct. Under these circumstances it appeared to the Court that the whole ground was cut from under the plaintiffs' feet. It was clear to the Court that there was no ground whatever for saying that Mr. Hunt had acted improperly in giving the certificate. For these reasons the application would be dismissed with costs.

THE "HERMITE" SYSTEM.

THE two reports that have just been published relating to the Hermite system will be read, says the *Standard*, with a good deal of interest. Great things were claimed for this novel application of electricity, and if these claims prove to be well founded it would perhaps be not too much to say that M. Hermite's discovery would go far to revolutionise sanitary science. Let us look first at the concluding sentences of these two reports to ascertain the results that have been arrived at. We will take Dr. Kelly's first, and as our readers will at once see, he utters no uncertain sound. His words are as follows:—"Since there is no instantaneous decomposition of faecal matter, and no sterilisation of sewage, I am of opinion that the process, so far as the late trials have gone, has therefore failed to produce the results which are claimed for it by its inventor." In marked contrast to this unfavourable view let us quote the exact words of Dr. Piton:—"En résumé, les expériences auxquelles je me suis livré me permettent de conclure que l'eau de mer électrolysée est un désodorisant parfait et un excellent antiseptique, qui détruit très rapidement les micro-organismes les plus résistants, à la condition d'assurer un contact intime du micro-organisme et de l'eau électrolysée." In face of these diametrically opposite opinions the general public may well exclaim, "Who shall decide when doctors disagree?" In this case, however, a brief examination of the methods adopted by the two reporters may go far to show on which side truth probably lies. Dr. Kelly gives the results (1) of his own experiments; (2) of the chemical analysis by Dr. Dupré, F.R.S., of three samples sent to him by Dr. Kelly; and (3) of the bacteriological analysis by Dr. Klein, F.R.S., of St. Bartholomew's Hospital. It is not at all unfair to Dr. Kelly to say that his experiments have no bearing, direct or indirect, on the question of the sterilisation of sewage. In fact, if they have any bearing on the Hermite process at all, it is only on the very subsidiary question of the action of electrolysed water on drainage pipes and fittings. His experiments, so far as recorded, appear to have been limited to a series of investigations into the respective actions of sea water, chlorinated lime solution and Hermite solution, on such substances as mortar, neat cement, cement, clay, paper, indiarubber, dyed leather, thin harness, copper, black iron, galvanised iron, zinc, tin, brass fittings, and so on. It is needless to follow up this subject, as neither its intrinsic importance nor the recorded results of Dr. Kelly would warrant our doing so. Dr. Dupré has reported

with the strict scientific accuracy for which his name is a guarantee. He tested Hermite solution, sea water and sewage treated with Hermite fluid. The last is the point with which the public are concerned chiefly, and we quote the following words from this portion of his report:—"The sample of sewage is evidently of somewhat abnormal character, and does not seem very well suited for experimental purposes. Without a direct comparison between the treated and untreated sewage, it is impossible to say what improvement the treatment has effected. I may say, however, that this sample does not smell like ordinary sewage, and has not developed an offensive sewage smell after a week's keeping."

Dr. Klein had samples of sewage treated with Hermite fluid, of sea water, and of Hermite solution. Dr. Klein's report is too full to quote at length, but we make the following extracts:—"Ordinary raw sewage of London, Manchester and other towns that I have examined, contains between three millions and ten millions of bacteria per 1 cc.; it follows that there has been effected by the admixture of the Hermite solution a remarkable reduction in the number of living microbes, but it also follows that nothing like sterilisation has been produced, since a considerable number of bacteria have survived the process." Dr. Klein also tested the effect of the Hermite solution supplied to him by Dr. Kelly on both cultures of bacillus coli, bacillus of typhoid and cholera vibrios. The result was this:—"All subcultures in broth showed growth. . . . There is one point in connection with this series of experiments which is of importance, and this is that by the addition of the same bulk of Hermite solution to the original normal cultures, the numbers of living microbes had decidedly become reduced, although a good many living examples were still left. . . . It was found that by the Hermite solution the number of living microbes was reduced something like over one hundred times." These quotations show that the reports of Drs. Dupré and Klein, though they contradict the claim of instantaneous sterilisation made for the Hermite process, are in other respects far from unfavourable. For we presume that deodorisation and the reduction of living microbes over one hundred times are points of no small importance.

In marked contrast with the somewhat perfunctory experiments of Dr. Kelly are those of Dr. Piton. Nothing could be more thorough or exhaustive than the researches of the latter observer. He investigated the following points:—The stability of electrolysed sea water with various percentages of chlorine, the stability of a mixture of Hermite fluid with sea and fresh

water respectively, its deodorising power, its solvent action on faecal matter and on paper, the minimum quantity required to sterilise pure microbic cultures, and faecal matter, the minimum of time required for this sterilisation, the effects produced on the matters contained in two closets and diluting syphons of the police office at the commercial port where the Hermite apparatus was fixed, the best percentage to which the electrolysis should be carried to effect thorough antiseptics at the least expense. The Hermite solution was first tested as to stability in open and closed vessels, exposed to and protected from the light. In brief, it was found that exposure to air caused after a time deterioration of the Hermite fluid. In regard to the third point, Dr. Piton asserts that deodorisation is thorough, and that it is not a mere masking of the odours by the free chlorine, as the natural odour once destroyed never recurs. A most exhaustive and complete series of experiments was carried out by Dr. Piton, to ascertain the strength and amount of fluid necessary for sterilisation of pure bacillary cultures, of various specimens of sewage taken under varying circumstances. Experiments were made with pure cultures in broth of the cholera and typhoid bacilli and of the bacillus subtilis in a state of sporulation. The strength of Hermite fluid employed varied from a proportion of 1 per mille free chlorine to '75, '50, '36 and '25. The tubes with the cultures were kept at a temperature of 35 deg. After a contact of half, one and two hours respectively, tubes containing cholera, typhoid and bacillus subtilis cultures remained sterile after four days. 10 cc. of 1 per mille Hermite fluid were used to sterilise 1 cc. of pure culture. The experiments made with faecal matter are too numerous to quote in detail, but the conclusion arrived at is that 40 cc. of 1 per mille Hermite fluid are sufficient to sterilise one gramme of faecal matter, or about six litres for an ordinary evacuation. As might be expected, larger quantities of the '75 and '50 solutions are necessary for sterilisation.

Elaborate experiments were also made as to the time required for sterilisation, but it is unnecessary to go into all these details. We have already quoted the general conclusion at which Dr. Piton arrived as the result of all his experiments. Before the Worthing authorities decide against the Hermite system it would be well that a series of experiments similar to those of Dr. Piton should be carried out. Certainly a question of such vast and far-reaching importance not only to the town of Worthing, but to many other places, ought not to be decided either for or against from the results

of chemical and bacteriological investigation of one or two samples. It may well be that Dr. Kelly has arrived at his conclusion too easily and too hastily, and the question is of such importance that it deserves to be definitely settled one way or the other.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

HEWETSONS, Tottenham LONDON. W.

HOUSE FURNISHERS & DECORATORS.

Extract from THE GENTLEWOMAN (Mrs. PANTON)—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.**HUNTING AND SHOOTING BOXES** completely furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

ARCHITECTS' Plans and Designs exactly and faithfully worked to.

Tenders Free for ELECTRIC LIGHTING.

SANITARY Work, STRUCTURAL Alterations, and every kind of Interior & Exterior DECORATIONS.

440.—English Carved Oak Writing Table, Leather Top, on Casters. £15 10s.
Without Drawer and Pigeon-holes on Top, £10 10s.

N.B.—House and Estate Agency Offices (213 Tottenham Court Road),
SURVEYORS, AUCTIONEERS AND VALUERS.

TRADE NOTES.

THE new Board Schools, Dartford, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE building committee of the large new technical school now being erected at Birmingham, having carefully considered various improved schemes placed before them, recently selected the "Baird-Thompson" scheme and system, owing to its simplicity, efficiency and moderate cost. This system is a combination of automatic and mechanical ventilation, and while positive in its action, maintains a uniform temperature and creates no draughts. Messrs. Baird, Thompson & Co. have issued from their London office, at 159 Queen Victoria Street, a new illustrated catalogue describing their system.

WE have received from Messrs. J. & H. Patteson their new circular containing a list of important works lately executed by them in marble and mosaic. In addition to their Italian marble and ceramic mosaic pavements, at the show-rooms may be seen a very large stock of chimney-pieces of latest designs. All descriptions of work in marble, granite and stone, in fact, are carried out by them, as well as statuary, monumental work, fonts, pulpits, reredoses, artistic pottery, pedestals in marble, granite and mosaic, &c.

THE tender of Messrs. J. D. Young & Son, of the Iron Foundry, Barnstaple, has been accepted for providing the ornamental railing which is to be erected as the boundary between the North Devon Athenæum Garden and road, at the entrance of the Taw Vale Parade, Barnstaple.

THE Mersey Docks and Harbour Board have approved a recommendation of the works committee to reconstruct that portion of the shed recently destroyed by fire on the east quay of the Prince's Dock, at an estimated cost of 2,660*l.*

THE Rhyl Improvement Commissioners have agreed with the contractor (Mr. Law, of Kidderminster) to make the Rhyl Marine Lake with 24 acres of water surface, instead of 18 acres as before intended. The total cost of the work will be 8,000*l.*, but only one-half has been let in this contract, which provides that the embankment and inlets and outlets shall be ready to impound the water by July 6.

MR. E. CURTICE (Romeike & Curtice's Press-cutting Agency) has brought out a newspaper index which will be extremely useful to the public. "Curtice's Index" applies to the *Times* and the other London and evening papers, 120 weeklies and thirty-one provincial papers. The volume which has just appeared covers the period between July 1 and September 30, 1893. The first pages of this volume explain it fully and clearly. Turn up the index, and you will find the newspaper, date and column in which the particular matter in which you are interested has appeared. The index extends to 267 quarto pages.

THE following letter, dated May 21, 1894, from Mr. D. Rodrigues, a well-known diamond merchant of Hatton Garden, has been received by Milner's Safe Company, of Finsbury Pavement:—"I am more than delighted to inform you that the strong safe which I purchased from you six weeks ago has withstood the most determined attempts to open it. Burglars entered my premises between Friday evening last and Monday morning, and there is evidence of their having been at work upon the safe for upwards of thirty hours. They have made

holes in the floor for the purpose of fixing a drilling machine, with which strenuous efforts have been made to open the door, but they have proved utterly futile, the safe remaining intact. They have also failed to open a smaller safe, which I purchased of you twelve years ago."

THE *York Herald* says:—Since the separation of the two towns of Malton and Norton, the question of the great cost of the old steam pumping-engine at the waterworks has become a most serious one for the Board of Health and the town. Norton went in for a new water-supply of its own, and put down a new gas pumping-engine and appliances. Mr. Henry Tobey, manager of the Malton Gasworks, says:—"The cost of gas at Norton for the whole twelve months has only amounted to 38*l.* 18*s.* 6*d.*, and for the engine-man 31*l.* The latter item might have been reduced to about 15*l.*, as it is not necessary to give assistant attention to the engine. The cost of coals for Malton during the same twelve months has amounted to 256*l.* 1*s.* 6*d.*, and engine-man, repairs, oil, waste, rent, boiler insurance, &c., 273*l.* 15*s.* 6*d.*—a total of 529*l.* 17*s.* 1*d.*" The surveyor to the Uxbridge Local Board recently reported to the committee that whereas formerly the steam-engine and the pumps working fourteen hours per day cost 555*l.* per annum, the expense of running the gas-engine and pumps working seventeen hours per day only amounted to 374*l.* per annum. The gas company have offered the Malton Board to put down a gas-engine and efficient set of pumps for 475*l.*

BUILDING AND BUILDERS.

THE Tottenham School Board have commenced another large school near the Alexandra Palace, in the Bounds Green Road. The contract has been let to Mr. Charles Wall, of Chelsea, at 14,800*l.* (who is just completing two other large schools for the same Board), and the plans have been prepared by Mr. E. H. Lingen Barker, architect, of London, Hereford, and Swansea.

WE understand, the *Tablet* says, that it has been definitely decided to begin the building of the Westminster Cathedral, if not immediately, at least in the near future. The new cathedral is to be upon a scale in every way worthy of its purpose, and on the magnificent site which was secured some years ago, opposite Archbishop's House.

A SITE on the Great Orme's Road, West Llandudno, has been selected as a gift to the Rev. John Morgan, rector, on which to build a new church.

VARIETIES.

AN inquiry has been held into an application by the Atherstone Rural Sanitary Authority for permission to contract a loan of 11,412*l.* for works of water supply for Baddesley, Emor, Baxterley, Bentley and Merivale.

AT the Bradford Town Hall an inquiry was held in reference to the application of the County Council for power to borrow 125,313*l.* for sewage works, including the diversion of the Bradford Beck, the erection of a refuse-destroyer on a site near Stanley Road, the construction of railway sidings, &c., and a sum of 3,288*l.* for the extension of Cliffe Lane to between Bolton and Otley Roads.

THE Victoria Bridge Board, Brisbane, have accepted the tender of Mr. John M'Cormick for the construction of the piers and superstructure of the new bridge. The amount of the tender is 92,952*l.*, and that of Mr. A. Midson, for abutments and approaches, 16,373*l.*

AT a general meeting of the Mason College Engineering Society, held in Mason College, Birmingham, a paper on "Ironmongery" was read by Mr. John Ashford. The methods of moulding with green sand and dry sand were explained, and the various foundry sands and their preparation described. The relative advantages of mixing sands in the pug-mill and by the Schultz-mixer were discussed. Stereo and plate patterns for repeat castings were shown and their use fully illustrated, the author concluding with a description of the Lieder moulding machine, a working model of which was shown.

THE mansion-house of Ellary, on the shores of Lochkilleshport, twelve miles from Ardrishaig, has been destroyed by fire, the damage amounting to about 10,000*l.*

ROOKERY MILLS, Huddersfield, have been destroyed by fire, as also a cottage and a public-house on the opposite side of the road. The damage is estimated at 40,000*l.*

THE Runcorn Improvement Commissioners have purchased the undertaking of the Runcorn, Weston and Halton Waterworks Company for 67,500*l.*

THE death is announced of Mr. John Clark, senior partner of the firm of Messrs. Clark & Co., thread manufacturers, at his town residence, Gateside, after a prolonged illness. The deceased, who was over sixty years of age, gave to Largs, of which he was several times provost, a United Presbyterian church and hospital, and was one of the originators of the Paisley Convalescent Homes at West Kilbride.

DAMAGE to the amount of 5,000*l.* was caused by fire in the west wing of Denstone College, near Alton Towers.

THE collection of portraits exhibited at Mr. Ichenhäuser's Gallery in New Bond Street contains about fifty masterpieces, which are worth seeing. There is also an interesting assemblage of old furniture.

THE steeple of the Shurdington parish church, near Cheltenham, has been struck by lightning during a heavy thunderstorm which passed over the district. The tower is cracked and the roof damaged.

ELECTRICAL.

THE United Methodist Free Church in Adelaide Street, Blackpool, has just been enlarged by the addition of galleries, &c., so as to accommodate 200 additional worshippers. The electric light is installed, representing 1,758 candle-power.

AN electrical exhibition has been held at the Municipal Buildings, Dover, in connection with the introduction of the light into Dover. The exhibition was attended by large numbers of people from towns in Kent. A novel experiment of a concert from London was made with the telephone under arrangements with the National Telephone Company, the London music-halls, &c., being connected with the hall. A special room was set apart for the purpose.

At the meeting of the Society of Engineers on Monday, the 4th inst., a paper will be read on "Power Distribution by Electricity, Water and Gas," by Mr. Ed. C. de Segundo.

At the meeting of the Worcester watch committee it was resolved to recommend the Council to fix the charge for the private supply of electricity at 5d. per unit, which is equivalent to 2s. 6d. per 1,000 feet for gas. The proposal for suspending arc-lamps over the roadways was abandoned, and the Brush Company were requested to submit designs with prices of brackets for fixing lamps on houses in the streets.

FOUR mills in Flash Street, Bolton, belonging to Messrs. Ormerod, Hardcastle & Co., Limited, are about to be fitted with a complete installation of the electric light. The plant consists of one large dynamo capable of lighting 1,300 lamps and taking about 120 horse-power, obtained from one of the mill engines, and in addition there is a small pilot dynamo of 100 lamps capacity, arranged to run off the same shaft or from a small auxiliary engine, as required. The contract for the work has been let to Messrs. Bennett & Duce, of Preston, and the design and arrangement of plant have been carried out by Messrs. Shepherd & Watney, consulting engineers, Leeds.

NOTES ON NOVELTIES.

Greenhouses on Wheels.—Agriculturists generally, and horticulturists in particular, whether amateur or professional, will be glad to hear of an important innovation which is being introduced by the Horticultural Travelling Structures Company. The novelty of the idea consists in the greenhouses, or plant-protectors, being provided with wheels constructed to run on a permanent or temporary rail-track, by which means the same structure will perform the work which would by the old system require a series of such shelters, thereby effecting an enormous saving in original cost and ultimate maintenance. For instance, a house which under ordinary circumstances would have lain idle during a large portion of the year will, by using one of the structures referred to, be in constant use for protecting and cultivating crops, and in the case of growers who, by the pressure of competition, have been forced to a constant use of their houses, instead of having to carry in batches of plants from the open air there will be a vast saving of time and labour by simply moving the whole structure, as supplied by the company, bodily over the plants as they stand. A great saving of labour in watering is likewise effected, as the houses run so lightly that one of, say, 15 feet by 12 feet, can be instantaneously moved by one man, so that advantage can be taken of even a passing shower. Ground, moreover, undergoing cultivation by the aid of one of these structures is periodically exposed to the action of sun, air, rain and frost, which are most destructive to the parasitic fungi, bacteria and even insect pests, which thrive in the close and moist conditions of the ordinary fixed structures. The hot-water apparatus moves with the structure, and thereby saves the cost of extra piping and boilers; and among the many other advantages claimed by the company for their patents, two may be cited which will be readily appreciated by all classes, *i.e.* that being movable no doubt can arise that they are tenant's fixtures, and consequently they do not entail increased assessment for rates and taxes.

THE MANCHESTER SHIP CANAL.

IN connection with the loan of 5,000,000*l.* from the Corporation of Manchester to the Ship Canal Company, a lengthy report by the corporation engineer, Mr. Hill, dated April 12, 1894, has appeared. When Parliament authorised the loan of the last two millions of the five millions it was to meet a cost of remaining works and equipment (as estimated in June 1892) of 2,183,483*l.*, and the actual outlay to the end of last year was 1,902,440*l.*, but the outlay still needed is set down at 277,839*l.* Mr. Hill's report states, further on, that the estimate of June 1892 "did not contemplate or provide for many important works or for equipment which might in the future be necessary, and to which attention up to the time had never been directed, or for compliance with Parliamentary obligations not immediate. So far as the work was contemplated under the June estimate of 1892, this has been done within the estimate." He goes on to say:—"By the half-yearly statement prepared by the canal company as from January 1, 1894, the capital powers and other assets available amounted to the sum of 1,059,108*l.* This was the whole balance left of the 5,000,000*l.*, and takes credit for 73,081*l.* as then available from shares in the hands of the company. It also includes a sum of 66,287*l.*, which is deposited under the terms of the London and North-Western Railway Company's arbitration, which cannot be taken into account. Deducting these two sums, the balance is reduced to 919,740*l.* This sum of 919,740*l.*, plus 60,000*l.* which may be available from balances on former estimates when the contracts are settled up—together 979,740*l.*—is the total balance left to meet future expenditure as from January 1, 1894. This sum is exclusive of 384,448*l.*, the accumulated revenue account of the Bridgewater undertaking up to the end of 1893, as shown in the company's balance-sheet."

On February 9 last the traffic committee recommended prompt efforts by the executive committee to provide works for which, though no drawings or information were available for a definite estimate, Mr. Hill was of opinion that 1,000,000*l.* might be needed. The executive committee requested that the matter might be reconsidered, with the result that the traffic committee drew up an amended list of works which they considered (February 16) "most urgently required and absolutely essential for traffic now being negotiated for and in course of development." These were estimated by the engineers to cost 443,000*l.* Deducting 184,000*l.* for requirements that did not belong to equipment, the real sum for equipment was 259,000*l.* One of the items included in the 184,000*l.*—viz. 73,000*l.*—was,

however, neither construction nor equipment, but was for further dredging in the removal of silt, mainly in the tidal part of the canal. As the canal for the portions referred has been once excavated to its full depth and width, Mr. Hill observes that the Corporation have not the power to devote any of their loan to its maintenance, and this remark will apply to all parts of the canal under the same conditions.

The estimated expenditure, less resources, as from June 1, 1892, was 1,499,282*l.* After provision has been made to complete these works, and including 95,201*l.* for works which have arisen since June 1892, a balance of 401,624*l.* remains, to which may be added the amount realised for plant. The work contemplated under the June estimate of 1892 was practically completed for about 1½ million over the loan unexpended, but, including the works which have arisen during the progress, and additional equipment provided for the opening, this half million has been reduced to 401,624*l.*

NEW FIRE STATIONS IN LONDON.

At the meeting of the London County Council on Tuesday the important subject of providing additional protection from fire in the Metropolis came up for consideration. In February last the fire brigade committee drew up a long report on the provision of additional protection from fire in London. The report came before the Council on March 6, and, in accordance with the resolution then adopted, the committee now presented a further report showing what part of the scheme they considered should be carried out during the present financial year, and what charge in respect of capital and maintenance would be thereby entailed. Of the four fire-engine stations which they recommended should be established, the committee were of opinion that, provided a suitable site could be obtained, the one at Streatham should be proceeded with, and that sites should, if possible, be acquired this year at Perry Vale and Shepherd's Bush, but that building should not commence till next year. Out of the twenty-four proposed additional sub-stations they recommended that ten should be put in hand, viz. North End Road, Fulham; High Road, Kilburn; Strand (near the Law Courts); Piccadilly Circus; High Street, Homerton; Burdett Road, Limehouse; North Woolwich; Lee Green; Battersea. Park Road; Brixton Hill. Of the fifteen proposed additional hose-carts and fire-escape stations they recommended the commencement of duty this year at Hornsey Rise; Aubert Park, Islington; St. Leonard's Row, Poplar, and Rye Lane, Peckham. the five proposed additional hose-cart stations, they thought three should be dealt with, viz. York Road, Camden Road; Mile End Road, and Anerley Road, Penge. Of the fifty proposed they recommended the establishment this year of sixteen additional fire-escape stations in the following localities:—Wandsworth Bridge Road; Fulham Palace Road; Blythe Road, Hammersmith; Alpha Road, Regent's Park; Haverstock Hill; Mill Lane, Hampstead; Malden Road, Kentish Town; Victoria Park Road; Bow Common Lane; Beresford Square, Woolwich; Burnt Ash Road, Lea; Mayow Road, Forest Hill; Lower Streatham; Loughborough Junction; Balham Hill; and East Hill, Wandsworth; and of the ten proposed additional steam fire engines they were of opinion that five should be purchased and stationed at the Notting Hill, St. John's Wood, Bethnal Green, Isle of Dogs and West Norwood stations. They also submitted a rough estimate of the expense which the adoption of their recommendations would this year involve, amounting to about 6,000*l*.

Lord Carrington, the chairman of the committee, in moving the reception of the report, explained that, in addition to spending 100,000*l*. capital expenditure on land, buildings and plant during the next five years, the annual expenditure for maintenance, including the wages of the additional staff that would be required, would gradually increase until the brigade cost the ratepayers 30,000*l*. The loan of 100,000*l*. was to be repaid in fifty-five years. Having stated the proposals of the committee as set out in the report, his lordship concluded by remarking that they were only what were absolutely necessary for the protection from fire of this great Metropolis.

Mr. Saunders, M.P., moved as an amendment that the fire brigade committee be requested to report to the Council as to the cost of providing and using the injector hydrants where high-pressure mains were already laid down; also as to the amount of pressure which would thus be obtainable in the event of a great fire in the locality where such hydrants were provided, and whether the use of such hydrants had been of advantage at Hull, and what had been the effect of the introduction of high-pressure water on the prevention and extinction of fire in Manchester.

Colonel Howard Vincent, M.P., thought the scheme of the committee was the least they could undertake in justice to the vastly increasing population of the Metropolis and the enormous property under the control of the Council.

The recommendations of the committee were agreed to.

EARLY HISTORY OF GAS-LIGHTING.

THE existence and inflammability of coal gas have been known for more than two centuries. In 1659 Thomas Shirley attributed the exhalations from the burning well of Wigan, in Lancashire, to the coal-beds which lie under that part of the county. Soon after Dr. Clayton, influenced by the reasoning of Shirley, actually made coal gas, and detailed the results of his labours in a letter to the Hon. Robert Boyle, who died in the year 1691. He says he distilled coal in a retort, and that the products were phlegm, black oil, and a spirit which he was unable to condense, but which he confined in a bladder. These are precisely what we now find, but under different names; the phlegm is water, the black oil is coal tar, and the spirit is gas. Clayton several times repeated the experiment, and frequently amused his friends with burning the gas as it came from the bladder through holes made in it with a pin. This was a hint which, in an age more alive to economic improvement, might have brought gas-lighting into operation a century earlier, though the mechanical difficulties might have been too great to overcome at that period—a circumstance which has retarded the introduction of many valuable discoveries, as it did that of the steam-boat and the printing-machine.

In the year 1733 Sir James Lowther communicated to the Royal Society a curious notice of a spontaneous evolution of gas at a colliery belonging to him near Whitehaven. While his men were at work they were surprised by a rush of air, which caught fire at the approach of a candle, and burned with a flame two yards high and one yard in diameter; they were much frightened, but put the flame out by flapping it with their hats, and then all ran away. The steward of the works hearing this went down himself, lighted the air again, which had now increased, and had some difficulty in extinguishing it. It was found to annoy the workmen so much that a tube was made to carry it off. The tube projected four yards above the pit, and at the extremity of it the gas rushed out with much force. "The gas being fired," says the account, "it has now been burning two years and nine months, without any sign of decrease." Large bladders were filled in a few seconds from the end of the tube, and carried away by persons who fitted little pipes and burned the gas at their own convenience. We do not learn what became of this copious supply; it probably diminished as the coal-bed was exhausted.

WORKS, ROTHERHAM. Estab. 1854.

Soon after the middle of the last century, Bishop Watson made many experiments on coal gas, which he details in his "Chemical Essays." He distilled the coal, passed the gas through water, conveyed it through pipes from one place to another, and did so much that we are only surprised he did not introduce it into general use.

But although the properties of coal gas were known to so many persons, no one thought of applying it to a useful object until the year 1792, when Murdoch, an engineer residing at Redruth in Cornwall, erected a little gasometer and apparatus, which produced gas enough to light his own house and offices. Murdoch appears to have had no imitators, but he was not discouraged, and in 1797 he erected a similar apparatus in Ayrshire, where he then resided. In the following year he was engaged to put up a gas-work at the manufactory of Boulton & Watt, at Soho. This was the first application of gas in the large way; but, excepting in manufactories or among scientific men, it excited little attention until the year 1802, when the front of the great Soho manufactory was brilliantly illuminated with it on the occasion of the public rejoicings at the peace. Accustomed as we are to the common use of gas, we cannot even now but be struck with such a display on a large scale; but the superiority of the new light over the dingy oil lamps used at that day, when thus brought into public view, produced an astonishing effect. All Birmingham poured forth to view the spectacle, and strangers carried to every part of the country an account of what they had seen. It was spread about everywhere by the newspapers, easy modes of making gas were described, and coal was distilled in tobacco-pipes at the fire-side all over the kingdom. Soon after this several manufacturers, whose works required light and heat, adopted the use of gas; a button manufactory at Birmingham used it largely for soldering; Halifax, Manchester and other towns followed. A single cotton-mill in Manchester used above 900 burners, and had several miles of pipe laid down to supply them; the quantity made averaged 1,250 cubic feet per hour, producing a light equal to that of 2,500 candles. Murdoch, who erected the apparatus used in this mill, sent a detailed account of his operations to the Royal Society in 1808, for which he received their gold medal.

But although the use of gas was thus spreading in the manufacturing towns, it made little progress in London. This may be accounted for in some measure by the circumstance that no means had as yet been found out for purifying it. It was dirty, it had a disagreeable smell, and it caused headache

when used in close rooms, besides spoiling delicate furniture. This was of little consequence in a manufactory, where there is generally ventilation enough to carry off unpleasant vapours, and rarely very delicate organs or fine furniture to suffer from their influence. But these defects were fatal to its general introduction in London, and until they could be removed there was small hope of success, though attempts were made, lectures delivered, and a number of interesting experiments made by a German named Winsor, whose perseverance and sanguine temper were very efficient in making the matter known to the public. But Winsor was deficient in chemical knowledge and mechanical skill, while he largely overrated the powers of the new instrument which he was zealously endeavouring to introduce. He took out a patent in 1804 and issued a flaming prospectus of a National Light and Heat Company, promising to subscribers of 5% a fortune of at least 570% per annum, with a prospect of ten times as much. A subscription was soon raised, it is said, of 50,000%, which was all expended in experiments without profit to the subscribers. Winsor, however, gained experience, and is said, we know not how truly, to have introduced the important measure of purifying gas by lime. In 1807 he lighted up Pall Mall, which continued for some years to be the only street in London in which gas was used. In 1809 the National Light and Heat Company applied to Parliament for a charter, but they were opposed by Murdoch on the score of prior discovery, and the charter was refused. It was, however, granted on a subsequent application, and the operations of the company became more extensive. But their profits had not yet begun, and increase of business was only increase of expense. The subscribers began to be alarmed at the exhaustion of their funds, and called loudly for a change in the management of their affairs. This was conceded, and the superintendence of their works was entrusted to Mr. Clegg, who had been for some years engaged in the erection of gas apparatus in Birmingham. Affairs now began to wear a better face; other parts of London applied for light, and new stations were erected. The business of the company steadily increased, and in the year 1823, in the course of a parliamentary investigation, it was shown that this company alone consumed annually 20,678 chaldrons of coals, which produced on an average 680,000 cubic feet of gas every night; this was distributed by means of 122 miles of pipe, which supplied more than 30,000 burners, giving a light equal to as many pounds of tallow candles. The other companies then established made altogether about the same quantity.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

SAND IN MORTAR.

It was probably noticed at an early time that pure lime mortar, if used as a stucco without a sufficiency of sand to prevent shrinkage, failed through the cracks and fissures which took place in it, and then the step was easy to the persuasion that, under all circumstances, sand should be used with mortar to make strong work.

When once this conclusion was accepted no attempt was made to verify its accuracy, and the whole attention of those interested in building was turned to the discovery of the way in which the assumed fact might be accounted for. As, however, this had no existence, it is scarcely matter for astonishment that there should be wide differences in the proportion of sand supposed by different writers to be the best—that there should be little agreement in their modes of accounting for the supposed increase of resistance due to its action, and that, finally, it should be left to the workman to do pretty much as he pleased in compounding his mortars.

Vitruvius states that "when the lime is slaked, it is necessary to mix three parts of sand, if the sand is fossil" (by which term he means pit), "with one part of lime; and if the sand is river sand, to add two parts of it to one of lime." "Such," he says, "are the proportions best suited for making mortar," and he endeavours to account for the fact of this mixture hardening in the following manner:—"The weight of the lime, after calcination, is diminished about one-third by the evaporation of the watery parts; from this it results that the pores, being empty, are better fitted than before to receive the admixture of sand, and to unite strongly with the blocks of stone to form solid masonry."

Perrault endeavours to prove Vitruvius was correct, and that his explanation coincided with that of the chemists of his time. These believed that the limestone having lost, by the action of the fire, all the volatile parts, which were the cause of its hardness, is left full of empty pores, formed by an extremely dry and arid matter, which absorbs with avidity the humid portions of the atmosphere; but as these cannot restore to it the components which it loses by calcination they reduce it to an impalpable powder, and it is this avidity of the lime which produces its causticity. When this property acts on the sand and on the stones it brings out of them, with time, a part of the sulphurous and volatile salts which they contain, and produces between them so strong an adhesion as to form a solid and hard body. They thought, further, that the sand loses a por-

tion of its hardness, and that the lime profits by this loss, and thus a mutual disposition to unite strongly is developed; consequently, when an attempt is made, after some time, to separate the stones of masonry built with good mortar, the mortar is observed to adhere with great force to their surfaces.

It is evident that so far no sufficient reason has been given for the supposed effect of sand. Its beneficial action being assumed, fanciful theories are sought in explanation of it.

Macquer says that the cause of the action of mortar may be deduced naturally from the properties of the lime, and it is especially owing to the fine division of its particles when it has been slaked. This extreme state of division, which reduces the particles almost entirely to surfaces, enables them to attach themselves very closely to the superficies of the sand or the cement (calciné clay, puzzuolana, &c.), and to adhere with a force proportional to the accuracy and intimacy of contact. With reference to the question why paste of lime without sand does not reach the consistency and hardness of mortar (for he, like his predecessors, takes the beneficial action of sand for granted), Macquer supposes that generally the particles of slaked lime adhere more closely to hard bodies than to each other on account of the great quantity of water united to them, which prevents their coming so closely into contact as they do with sand or cement, for these substances, by absorbing a portion of the water of the slaked lime, facilitate the drying and adhesion. Though this reasoning is on the whole perhaps better than that of previous writers on the subject, the questions of adhesion and cohesion being considered and arguments worth weighing at least brought forward in support of the superiority of the former, it is hardly necessary to say that silicious sand cannot absorb a perceptible quantity of water.

Belidor prescribes two or one and a half measures of sand to one measure of lime paste; or, if the lime be very fat, three measures of sand to one of lime paste; this amounts to one or three-quarters sand to one measure of slaked lime in powder for ordinary cases, or one and a half sand to one part of lime powder, if the lime is very fat.

Rondelet, after carefully considering the theories of preceding authors, determines that no precise rule can be laid down for the proper proportion of lime and sand, and appears to have arrived at pretty much the same conclusion as Belidor. He says "that there is quicklime, such as that of Melun, which absorbs, in slaking, two and a half times its weight of water, to form a paste moderately fluid, such as is required for ordinary mortar, without being obliged to add more water. There

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

may be found other lime which, in order to form a paste of equal consistency, consumes only a quantity of water equal to its own weight. It has been found, from numerous experiments, that in order to make good mortar with the first of these pastes it is necessary to mix three parts of river sand with one and a half parts of lime" (or equal parts of sand and lime if the lime is measured in powder), "and in making use of the second paste, two parts are necessary for three parts of the same sand. These two mortars, when equally well mixed, acquire, with time, the same consistence." "It is necessary to observe," he continues, "that in the first mortar the quantity of lime in paste is half the sand, and in the second two-thirds; however, since Vitruvius all who have written on the art of building have repeated that, in order to make good mortar, it is sufficient to mix one part of slaked lime with two parts of river sand, but it is requisite to suppose a lime of superior quality to that of Melun, which, however, is considered very good. As to the quantity of quicklime in these two mortars, I found that in the first it is only one-seventh of the sand, whilst in the second it is one-third of it. It is this last proportion which M. De la Faye prescribes. In order, in all cases, to make a proper mixture a certain amount of experience is required to judge of the degree of consistence which well slaked lime and mortar sufficiently mixed should have. It is this degree which determines the quantity of water for slaking the lime and the quantity of sand necessary to make good mortar.

Rondelet here takes up new grounds. Assuming, like his predecessors, that sand acts beneficially on mortars, he considers that they were wrong in prescribing the same dose of it for all limes without regard to quality, and that the object to be attained is a compound which will have that degree of plasticity which a skilful workman finds to suit him best. He goes on to say, indeed:—"In all the parts of France and Italy through which I have travelled I have questioned those workmen who appeared most intelligent. I have found that their knowledge reduces itself to a practical knowledge which usage and experience render sufficiently sure. . . . A workman who, by a long experience, is accustomed to judge if the mortar is fat enough, enough worked, and if it has the consistence it ought to have, is rarely deceived; he beats and mixes the different ingredients of which it is composed until he has hit off the point he aims at," which, in these days at least, is that point which will give the least trouble.

Dr. Bry Higgins, who wrote twenty years before Rondelet,

prescribes that no more than one part of lime to seven of coarse sand ought to be used in mortar to dry quickly, and less lime may not be used, because it does not render the mass sufficiently plastic for building or incrustation. He subsequently states that this is the best proportion, whether the mortar is to be quickly dried or not. Dr. Higgins measured his ingredients by weight, and according to Smeaton's calculation Thames sand weighs four and a half times as heavy as the slaked powder of common lime; the above proportion therefore is somewhat under one and a half parts sand to one of lime in slaked powder, or three parts sand to one of lime measured in paste.

The discrepancy between Higgins's statement and Rondelet's as to the amount of sand which gives the best consistence for working is to be accounted for in this way:—Dr. Higgins, though concluding the above proportions to be the best for building purposes generally, arrived at them by experiments made with reference to stuccoing, for which purpose freedom from shrinkage is a more valuable property than freedom in working. He decided, in fact, on the most plastic composition which did not crack in drying.

Smeaton, whose opinions perhaps will carry more weight than those of any of the writers quoted, says:—"The use of sand in mortar, so far as I have been able to observe, is twofold—first, to render the composition harder, and, secondly, to increase it in quantity by a material that in most situations is of far less expense, bulk for bulk, than lime. As there is no apparent change in the sand by the admixture of the lime, the sand seems only to render the composition harder by being a harder body; for the best sand, being small fragments of flint, crystal, quartz, &c., is much harder than any body we know of that can be formed of lime only, and which, in paste, is to be considered as a cement to the harder materials, and therefore composes a harder body; for the same reason that, if we had nothing naturally but lime as a cement, and should build a wall with flints, crystals, or rough stones cemented therewith, this wall would be far harder than if built with lime alone."

Smeaton did not, however, apparently arrive at this conclusion from comparative experiments on resistance of different mixtures, for in the next paragraph he continues:—"The experience of ages has shown that a considerable quantity of sand and other matter may be introduced with advantage in the making of mortar, but the proportion has never been agreed in; yet from common experience it appears that there

16 Southwark Street, S.E.

is scarcely any lime but what, if well burnt and beaten, a load or measure of lime will take two loads or measures of sand—that is, the quantity of sand that can be introduced into its composition may equal the lime in powder. . . . Finding this idea so far to answer not only in experiment, but my expectations satisfied in works at large, I was induced to try whether lime would not bear a still greater addition of sand, and I soon found that it would, with good beating, take in for every two measures of slaked lime one measure of tarras and three of clean sand. . . . Still pursuing the same line of experiment to see how far this matter could be carried, it appeared that even yet a greater proportion of sand could be introduced, but to bring it to a proper consistency and toughness, so as to be a good cement to large stones, I found it needed so much more beating that the labour became in most cases of more value than the saving of the materials." The proportion last employed, he adds, in a footnote, agrees, allowing for the tarras, with the greatest mixture of sand and lime of Dr. Higgins, which was scarcely two of sand to one of lime powder.

In the same note Smeaton states, "I have long since found the necessity of forming a composition of fine and coarse sand for mortar, unless the sand is naturally so mixed, for as the lime will receive the most sand in that way, without losing its plasticity, it will of consequence make the hardest and firmest mortar."

In concluding that those mortars must of necessity be the best which have as much sand as they can carry without losing the toughness and plasticity which the workman has reason to prefer, Smeaton must either have lost sight of the influence which the relative forces of adhesion of the lime paste to the sand, and of the cohesion of the particles of paste amongst themselves, must have after setting upon the resistance of the compound, or he must have assumed that the former was of necessity the greater, and that each grain of sand would be perfectly coated. Probably no doubt of the beneficial effect of a certain quantity of sand arose in his mind, and he adopted the view of the question in vogue in his day; his experiments, therefore, had reference rather to a point of manipulation than of principle; he wished to ascertain how far extra beating and perfect amalgamation would counteract what was considered an extra dose of sand.

Vicat, although doubtless led by his experiments to very correct results on the comparative resistances of mortars of different limes, yet carried on his trials generally in so unsatisfactory a manner, that General Sir Charles Pasley was led to

regret that he could not attach to them that confidence which the author places in them. In many instances he adopts views on small differences of resistance which further experiments would have caused to disappear. His opinions, therefore, should not have great weight given them, when unconfirmed by other observers. He draws distinctions between the composition that should be given to mortars—according as they are made from fat or hydraulic lime—as they are slaked by the ordinary method, by immersion or spontaneously, and according as they are intended for exposure to weather, to damp, or to vicissitudes of heat and cold. For fat lime, slaked in the ordinary method to be exposed to air, he gives the preference for strength and resistance to frost to 240 parts of sand to 100 of stiff paste of lime; for exposure to damp, he states that fat limes so slaked lose in resistance if more than 50 parts of sand to 100 of paste are used; for covered parts of buildings he puts the maximum limit of sand at 55 parts to 100 of lime in paste. He also asserts that the "intervention of pure sand does not tend, as was before believed, to augment the cohesion of which every kind of lime indifferently is susceptible, but it is injurious to rich limes, very serviceable to the hydraulic and eminently hydraulic limes, and is neither beneficial nor injurious to the intermediate kinds."

Colonel Raucourt de Charleville, an admirer of Vicat, and who was at one time employed by the Emperor of Russia on account of his experience in mortars, enlarges upon and illustrates, after a Frenchman's manner, the idea already quoted from Smeaton's work on the cause of the hardness imparted by sand to mortars. He states that "whenever the sand is harder than the cement, as there exists between them a reciprocal action, the more sand a mortar contains the harder it will be; that, in consequence, in order to obtain a mortar of maximum resistance it is necessary (1) that the sand be of such a size as to yield the greatest mass possible in a given volume; (2) that the grains of sand be arranged one against another; (3) that the cement to unite them only fills the intervals which separate the grains. Every addition beyond this will only do harm, just as abundance of felspar or mica injures the resistance of granites, which is only a particular case of this general principle, that the resistance of a mixture of substances depends chiefly on the resistance of the component of which there is most; whence it results that the minimum of cement or enveloping parts which can be added to sand, or the parts enveloped, to make the best mortar, is decided by the measure of the voids of the sand." Then follows an important

NOTICE.

Mr. JOHN GRUNDY has purchased the whole of the Valuable Stock and Patents of The Helios and Calorifer Stoves from Mr. H. HEIM, of Vienna and Oxford Street, London, W.

The Premises 95 and 97 Oxford Street will be open until June 24, and Architects and Builders are invited to call, as the stock, which is a very valuable one, will be sold at greatly reduced rates.

Telegrams:—"JOHN GRUNDY, LONDON." N.B.—Perfect Success Guaranteed or No Pay.

modification, which, indeed, appears to upset his illustration, if not his theory:—"With porous sands, the proportion of lime should be the same as for cement. With smooth sands, which cannot attach themselves mechanically to the lime, and which act on it as on the clays, in dividing them, the best plan would be not to add sand; but one does it for economy's sake, and especially because the employment of net lime is almost impossible on account of shrinkage." He recognises, then, the necessity that there shall be either a strong mechanical or a chemical adhesion to the sand, to enable the sand to impart strength to mortar; but if hydraulic limes have an action on sand, they have it by means of the free lime they contain, and pure lime would be more effective; next, the felspar has no chemical action upon quartz, and in the strongest granite the particles of quartz are quite as smooth as surfaces of sharp river sand; the granite illustration, therefore, of the general principle should better apply to the fat than to the hydraulic limes, and it is peculiarly to the fat limes that the common notion of just filling the voids of the sand is held to apply. Hydraulic limes are supposed to require somewhat less, and the theoretic reason given for this difference is that they already contain matter which is not calcareous; practically less is used because they do not, as Rondelet found, produce so fat a paste, and will not carry so much sand without working short.

The work of Sir Charles Pasley illustrates this point, and affords a striking example of the influence which a long-received opinion may have over minds most given to investigation and experiment, and the least disposed to receive matters on trust. "We found," he says, "by repeated experiments at Chatham that one cubic foot of Halling lime weighed nearly the same when fresh from the kiln, and by the gradual addition of water that it dilated to the same increased bulk in the state of quicklime powder, but when worked up into mortar, not too short for use, that it would not bear quite so large a proportion of sand as the common chalk lime had done. This experiment, leading to a result in opposition to a common opinion amongst the builders of the Metropolis, which is that the Dorking and Halling limes, as being stronger limes, will, when made into mortar, bear more sand than common chalk lime, I was induced to examine the principle upon which they found this opinion, which on consideration appears to me to be erroneous, because these two limes are undoubtedly in an intermediate state between pure lime, which is the weakest, and the water cements, which are the strongest of all calcareous cements, and every one will

acknowledge that the proportion of sand which will make good mortar with chalk lime would entirely ruin cement, which is scarcely capable of bearing one-third of that quantity. Hence it follows that the hydraulic limes ought not to admit of so much sand as chalk, but that they will bear more than cement without being injured."

The reasons for the London builders' notions on the subject can be accounted for by the fact of the misnomer of grey chalk lime already alluded to, for stone limes slake to a bulkier paste than chalk limes, as they contain more lime in a given measure; tunnel-burned lime also, such as the white chalk, contains more core than the flare-burned grey lime; but it must at once be admitted that if the proportion of sand which will make good mortar with chalk lime will not ruin all cements of the same natural character as those to which Sir Charles Pasley alludes, his whole argument falls to the ground. The practical builder has no need of any further proof than Portland cement daily gives him. He may be in doubt whether the sand has a beneficial effect on its strength or otherwise; but he will have no hesitation in denying Sir Charles Pasley's supposition that even a large proportion spoils it.

NORTHERN ARCHITECTURAL ASSOCIATION.

In the annual report for the thirty-fifth session of the Northern Association the committee say they are glad to be again able to record the increased prosperity of the Association. During the session, and since the last annual report (April 26, 1893), 9 members, 8 associates and 8 students have been elected, and the roll now stands as follows:—Members, 40; associates, 45; students, 28—total, 113. The increasing prosperity of the Association is no doubt partly due to the acquisition of a permanent room, and to the formation of the nucleus of a library, which is now contained therein; also, it is hoped, in a measure owing to the endeavours that have been made to cause its success.

In the summer circulars were issued to the members of the Association appealing for donations of books and for subscriptions towards the formation of an architectural circulating library, and, as a result, during the year over 40% and several books have been presented. The aim of the library committee (Messrs. J. H. Morton, F. W. Rich, H. C. Charlewood and A. B. Plummer) has been to select and suggest books from the list recommended to students by the Institute. A gift of

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above, are labelled, either inside or outside with our Trade Mark—"The Anchor."

READING CASES FOR THE ARCHITECT.
Price 2s.—Office, 175 Strand, London, W.C.

about forty volumes has lately been received from Mr. J. G. Walker. Better accommodation is about to be provided for the library, and as the collection is still far from complete further help is requested. The thanks of the Association are due to Mr. H. C. Charlewood, the hon. librarian, for the valuable services he has rendered in connection with the library.

In September the committee agreed to issue a circular offering a first prize of books, value 2*l.* 2*s.*, and a second, value 1*l.* 1*s.*, for the best sets of drawings, as follows:—One sheet to comprise one of the three orders, Doric, Ionic or Corinthian, fully figured, drawn in outline, with the ornament and enrichment filled in. The sheet to comprise two columns of one order, with entablature complete, drawn to a scale of $\frac{1}{4}$ inch (the columns being not less than 20 feet high and the details $\frac{1}{4}$ th full size). Also one sheet with one example of the Early English, Decorated or Perpendicular periods, such as a door, a window or an arcade, in plan, elevation and section. It was stated to be desirable that one of the above drawings be from actual measurement, and that they be completed by February 16, 1894. In response two sets of drawings were received under mottoes, "Pax" and "Pupil." Mr. Archibald Dunn again kindly adjudicated upon these drawings, and by his award the first prize was given to "Pax" (Mr. M. G. Martinson); second to "Pupil" (Mr. H. W. Featherstone).

The hon. secretary of the N.A.A. Students' Sketching Club reports as follows on February 21, 1894:—

"In presenting the fourth annual report, your committee regret that the progress mentioned in previous reports has not been maintained, and, although not wishing to shirk their responsibility, think that the individual members are greatly to blame in not seconding their efforts. A great number of places were suggested at the last annual meeting as being suitable for visits, but beyond that very little interest has been manifested in the meetings. With the very large membership of associates and students, and the facilities offered, the session should have been much more successful. An excellent opportunity of visiting Fountains Abbey and Ripon Minster was afforded on May 6, but only five members availed themselves of it. A meeting was also held at Hexham Abbey, and there was a better attendance. Another visit should have taken place at Tynemouth Priory, but had to be abandoned on account of the necessary permission not coming to hand. With the view of further interesting some of the younger members, we recommend the addition of three students to the sketching club committee."

The first excursion meeting of the session was held on June 3, 1893, at Hartlepool. The members travelled from Newcastle in a special saloon carriage, and on arriving at East Hartlepool they first visited the fine old church of St. Hilda, over which the party were conducted by Mr. Carse, the clerk of works, who kindly explained the recent restorations. Crossing the ferry, and walking to West Hartlepool, visits were made to the following:—Church of St. Paul (Mr. C. H. Fowler, F.S.A., architect); church of St. Aidan (Mr. J. H. Morton, F.R.I.B.A., architect); old church at Stranton (renovated by Mr. J. H. Morton); and the Municipal Buildings (Messrs. Freeman & Robins, architects). The members afterwards dined together at the Royal Hotel, and returned to Newcastle by the 9 P.M. train. Thanks were accorded to Mr. Morton for guiding the party during the day.

On July 1 a meeting was held at Durham, and, by the kind permission of the Dean and Dr. Plummer, the whole of the cathedral and castle buildings were inspected. The members had tea together at the Three Tuns Inn in the evening.

The annual excursion was held on July 12. The members travelled in a special saloon carriage by the 9.30 A.M. train south. A stay of an hour and a quarter was made at York, and the minster was visited. They afterwards proceeded to Selby and thoroughly inspected the abbey church. Conveyances were then taken to Hemingbrough, where the ancient collegiate church was inspected. Upon returning to Selby the party dined together at the Londesborough Arms.

On July 29 a meeting was held in Sunderland, and the following buildings were visited:—1. St. Hilda's Bishop Lightfoot Memorial Church (Messrs. Hicks & Charlewood, architects); 2. St. John's (Wesleyan), (Mr. Curwen, of London, architect); 3. St. George's (Presbyterian), (Mr. Wilson, of Glasgow, architect); 4. St. Columba's Church (Mr. C. H. Fowler, architect), and St. Columba's Schools (Mr. F. C. Caws, architect). The party had tea together, at the Roker Hotel, in the evening.

On October 7 a meeting was held at the Durham College of Science, Barras Bridge, and a vote of thanks was passed to Mr. F. W. Rich, architect, for kindly conducting the party over the new buildings.

On October 28 the Ouseburn Board Schools (Mr. F. W. Rich, architect) were visited. The members assembled at Grey's Monument, and by the kindness of Mr. Rich a conveyance was provided for them to and from the schools.

The first meeting of the winter session was held at the

Meeting-room, Art Gallery, on November 29, 1893, at which the President read his inaugural address, and Mr. E. Eugene Brown, M.I.C.E., read an interesting paper on "Electric Lighting," and illustrated the same with diagrams and models. A letter was read during the evening in connection with the prizes offered by the committee for the best set of sketches (books value 2*l.* 2*s.* and 1*l.* 1*s.*), and for measured drawings (books value 2*l.* 2*s.* and 1*l.* 1*s.*). The award was as follows:—

Sketches.—1st Prize, "Tynedale" (Mr. W. H. Reed); 2nd prize, "Yorkshire" (Mr. G. C. C. H. Crawhall).

Measured Drawings.—1st Prize, "Fontenensis" (Mr. C. D. Rochester); 2nd prize (Mr. R. P. Twizell).

At a subsequent meeting of the committee they resolved that the third and fourth sets of drawings, submitted by Mr. R. H. Morton and Mr. S. E. Barrow, be highly commended in the annual report.

On December 13 a meeting was held at the Art Gallery Meeting-room, at which Mr. H. W. Chubb, M.I.C.E., of London, delivered a lecture on "The Construction of Locks and Safes." He also dwelt with strong rooms and the ancient and Mediaeval branches of the subject. The lecture was illustrated by means of diagrams, models and lantern slides. Thanks were accorded to Mr. Chubb, and also to Mr. Cackett, for kindly illustrating the lecture by means of his lantern.

A sessional gathering was held on January 10, when Mr. Cackett exhibited by limelight and explained a number of architectural slides, illustrating various English cathedrals.

On January 13 the members visited the Chillingham Road Board Schools, Newcastle, when (in the absence of the architects, Messrs. Oliver & Leeson), the party were conducted through the buildings by Mr. Walker, the clerk of works. The "Plenum" system of heating and ventilating was in operation, and explained by Messrs. Dinning & Cooke.

On January 17 Mr. Bacon delivered a lecture on "Stained-glass in Relation to Architecture," illustrated by means of specimens and diagrams, and on January 24 Mr. C. E. Oliver, F.S.I., read a paper entitled "Notes on New Zealand Timbers," and exhibited specimens.

The claims and advantages of the Northern Architectural Association were laid before a meeting of architects held in the Masonic Hall, Sunderland, on January 27, 1894, and at this meeting Mr. G. T. Brown, of Sunderland, was elected corresponding member for that district. At this same meeting Dr. Gibbon, of South Shields, delivered an excellent lecture on "Athens," illustrated by limelight views.

The fourth annual social gathering in connection with the students' sketching club was held on February 5, 1894, in the Grand Assembly Rooms, Newcastle. An excellent programme of music and collection of photographs and drawings were provided, and there was a large attendance of members and their friends.

On February 14 Mr. Ralph Hedley read a paper on "Wood-Carving," and illustrated his remarks by several charcoal sketches executed on the spot. He also exhibited a number of photographs of carved work, together with examples of wood-carving. On February 28 Mr. A. B. Plummer read a paper on "Zinc and Zinc-roofing," and the subject was illustrated by means of specimens, models and diagrams. On April 7 the members of the Association, to the number of fifteen, visited the new Prudential Assurance Buildings (Messrs. Waterhouse & Sons, architects) in Dean Street, Newcastle, and were conducted by Mr. Monteath, the clerk of works.

The thanks of the Association are again due to those who have granted permission and given assistance in connection with the Saturday afternoon visits, also to the readers of papers during the winter session and to all who have in any way contributed towards the successful working of the Association during the past year.

BUDA-PESTH ELECTRIC TRAMWAYS.

SOME little time ago Alderman Ward, member of the Leeds County Council, being over in Vienna on business, paid a visit to Buda-Pesth with a view to seeing the system of electric tramways there in use, and he has kindly favoured us (the *Leeds Mercury* says) with an account of what he learnt in the gay capital of Hungary. The population of Buda-Pesth, it may be explained, is 550,000, but, in addition, there are 50,000 troops stationed there, so that it may be reckoned in round numbers at 600,000. Beautifully situated on the banks of the "Blue Danube," its people are of a much more easy-going nature than can be found in an English manufacturing town, and it almost, therefore, stands to reason that its vehicular arrangements should be of a somewhat luxurious character. The Buda-Pesth electric tramway was first begun some six or seven years ago by Messrs. Siemens & Halske, and when it had been completed, so far as the present lines are concerned, they floated it as a company with a capital of 4,000,000 florins, which in English money is a little over

ESTABLISHED 1860.

330,000/. The system is a conduit one. There are no overhead wires, but the electricity is conveyed underground with a conduit 22 inches deep. This depth is necessitated in order to avoid as far as practicable the possibility of a stoppage of traffic by rain-water and snow. The conduit is connected with the sewer at various intervals, and by this means any sudden influx of water is got rid of. The company in the first year of its existence paid a dividend of 7 per cent. on its capital, and last year it paid 8 per cent., and the shares on the market to-day stand at 225 florins for every 100 florins invested. The power-station is centrally situated, and from this point all the lines are worked. The total capacity at the company's disposal represents 1,750 horse-power, which means really that they possess a duplicate service of dynamos and engines in the event of a breakdown. On ordinary week-days a force of about 600 horse-power is required to work the traffic, but on Sundays—the Continental holiday-making day—a force of 800 to 900 horse-power is required. The fare charged is 6 kreutzers for one length; if a change is made, taking an additional line, the charge is 8 kreutzers; but if a double change is made, then 10 kreutzers is the fare. This means that for about 2d. English money a passenger may travel six to seven miles. The total length of the lines laid down on the conduit system is about 30 kilometres, or 16 English miles. There is also a short distance of tramway on the overhead system, but this will be reconstructed on the conduit system as soon as convenient. At first the company experienced some little difficulty in working the lines, occasioned by mischievous people interrupting the electric current by putting a piece of metal down between them; but this form of amusement did not last very long, and they have experienced no trouble of late. Slight interruption has also been met with from drifting snow, but it has never been of any serious duration, from half to three-quarters of an hour always sufficing to clear away the obstruction. In the low-lying portions of the city heavy rains have also occasioned slight difficulty, owing to the sewers not having sufficient capacity to take off the surface-water, which has flooded back into the conduit. But, with these slight drawbacks, the system works as smoothly as can be wished. Each carriage is constructed to carry thirty-two passengers, but as no by-laws exist against overcrowding standing-room is permitted, and so on occasions cars may be seen with from sixty to seventy people in them. Each car, including the motor, weighs from 4½ to 5 tons, and costs about 500/. The system is most popular in Buda-Pesth,

and last year the company carried no less than twelve and a half million passengers, which practically means that, taking an average, each individual inhabitant used the cars twenty-one times in the course of the year. This year, however, the company expect to overtop these figures by 2,000,000. Some idea of the favour in which the tramways are held may be gathered from the fact that on the Sunday before Whitsuntide no less than 75,000 people, or one in every eight of the population, used the cars, and the number run on that day was a little over one hundred. From the figures quoted no doubt of the success of the Buda-Pesth tramways can be entertained, but the cost of construction is very great. In fact, the cost per kilometre, including the central power-station, the workshops, the waiting-rooms, cars, &c., is 95,000 florins. A kilometre is about three-fifths of an English mile, so that the cost represents about 13,350/. per English mile.

WASTE OF COAL.

At the meeting of the North Staffordshire Mining Institute the subject of waste of coal was discussed. Mr. J. J. Prest said formerly it was customary to leave probably a third of a seam in the northern coalfield in the system of work then adopted; under similar conditions now probably not 5 per cent. all round was lost. In fact, many of the old workings were being reopened to recover coal left in former days. A large quantity of slack was buried without any good reason. The chief loss was in the system of leaving barriers surrounding the coal properties of individual proprietors, with the object of protecting themselves against the operations of their neighbours. Speaking of the North Staffordshire coalfield, he said, assuming each colliery proprietor had a royalty of 640 acres, or one square mile, and he was compelled to leave a barrier of forty yards, that would represent about 58 acres of coal in each seam. Assuming also that the area of the coalfield was 75 square miles, and there was an average thickness of 75 feet of workable coal, there would be 4,350 acres of workable coal abandoned, amounting to 391,500,000 tons, of the value of 9,787,500/., at 30/. per foot per acre, without taking into consideration its economic value to the consumer at large. With a view of preventing waste, he directed attention to the suggestions of the late Sir George Elliot on the subject, and said he thought they might also do much by the appointment of drainage commissioners, who should undertake the entire

pumping arrangements in any coalfield. Loss of coal could to a large extent be prevented when new seams of coal had to be opened. Mr. T. E. Storey, Mr. E. B. Wain, Mr. J. R. Haines, Mr. Baylis, Mr. W. N. Atkinson and the President took part in the discussion. It was stated in reference to the drainage that the scheme in operation in South Staffordshire might answer there because the seams were practically flat, whereas in North Staffordshire at one colliery a seam might be worked at a depth of 100 yards, and in the adjoining colliery the same seam might be worked at a depth of 500 yards.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

PETERBOROUGH.—June 9.—For Additions to Workhouse Infirmary. Mr. J. Stallebrass, Architect, North Street, Peterborough.

YSTRAD.—June 16.—For Pulling-down and Rebuilding James's Hall. Mr. J. Rees, Architect, Hillside, Pentre, Rhondda.

THE ALBERT PALACE, BATTERSEA.

It has been stated in some of the journals that the materials of the Albert Palace and Connaught Hall, Battersea, were sold at great sacrifice. That is erroneous. Indeed, we are surprised that the auctioneers, Messrs. Horne, Son & Eversfield, were able to obtain such high prices as prevailed. It should be remembered that the materials were supposed to be second-hand when employed. Of only a part of them could that be said, but the prejudice would of course affect all prices. However, the auctioneers managed to obtain sums that were exceptionally high. For the glass (exclusive of what was employed in the roof lights, which went with the ironwork), they obtained about 50%, which was a most liberal price, as the purchaser had to take down, pack and remove the glass. The floorboards were sold at 5s. per square, and joists 4s. per standard. Comparing those prices with those for new timber, it becomes evident that the fullest value was realised. The 800 tons of ironwork sold for 900%, but it should be remembered that at least 20s. a ton will have to be paid by the purchaser for taking down. The price given for hot-water piping was 3s. 10s. a ton, and it can be purchased new for 5s. The zinc on the roof fetched nearly 14s. per ton. The whole of the materials realised equally satisfactory prices, and the total exceeded the estimate made previous to the auction by about 40 per cent.

TRADE NOTES.

WE hear that Messrs. Forwood Bros. & Co. have advised Messrs. Baird, Thompson & Co. that the installation of their mechanical ventilation process in the steamship *Zweena* has given most satisfactory results. The owners express their intention of extending it to the remainder of their fleet. The managers of the Neptune Steam Navigation Company have formed an equally favourable opinion of the appliance; also a large firm of steamship owners in Hull, it is said, intend to carry out the system throughout their fleet.

THE County Asylum, Prestwich, near Manchester, has just been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with some more of their patent Manchester stoves, the patent Manchester stoves and grates previously supplied having proved so satisfactory.

THE Stamford Technical Instruction Committee have accepted the tender of Mr. John Woolston, of Stamford, for the erection of a technical education school on the Shambles at Stamford. Mr. Woolston's tender was for 980*l*.

THE building of the new railway-station in Weardale, Co. Durham, has been let to Mr. W. Lister, of Crook.

A FEW days since Messrs. Williams Bros. & Co. gave a private view of their new patent system of glass-roofing, for which they claim the following advantages:—The joints being butted the horizontal lapping of the glass is dispensed with,

thereby effecting a saving which the patentees estimate at from 25 to 30 per cent. A perfectly flat surface is the result, having no apertures through which the weather, however rough, can drive. The loss occasioned by breakage from contraction or expansion or vibration is obviated. Curved roofs can be covered as easily as straight. There is a great saving in cost of maintenance, as no external painting is required. There is no drip from condensation, and no rattle.

ELECTRICAL.

THE electric light has just been started in the pretty little church of St. Bride, Kelvinside, Glasgow. The supply is taken from the mains of the Kelvinside Electricity Company. The contract was carried out by Messrs. Claud Hamilton, Limited, of Waterloo, to the plans and specifications of Mr. W. Elsdon Dew, resident engineer to the supply company. The fittings are of ecclesiastical pattern in wrought-iron and copper, in harmony with the surroundings. It is understood that other churches in the district are proposing to adopt the electric light.

AT Houghton pit the electric light is to be installed, and Messrs. Hawthorn & Leslie, of Gateshead, are now engaged in the work. This is the third pit in the district owned by the Earl of Durham at which the electric light is used, whilst at Herrington New Pit an electric coal-cutter is also just now being tested.

SPECIAL collections have been made at the Leeds parish church to defray the cost of installing electric light in the church.

THE *Dundee Advertiser* says:—The fine chamber organ at Balruddery has just been reconstructed on the Hope-Jones electric system, and is now probably the finest organ in a private residence in the country. The organ has three manuals and about twenty-five speaking stops. The pipes are of exceptionally fine quality, having been voiced by Thynne. The instrument is placed in the gallery of the large hall, and is played from a movable console on the ground floor. The only attachment between the keyboards and the pipes is a flexible electric cable, and the console can be moved about to any part of the hall. Instead of stops at the side of the keyboards, there are stop keys placed over the top, exactly like a fourth row of white notes. These can be very rapidly manipulated,

Portable
Cistern
Filters.

being put up or down as fast as a finger is run along them. One key puts off the electric current operating the stop keys. By the use of this the stops can be altered without the alteration coming into effect until by a touch the current is turned on again. A remarkable feature is the double touch. By means of this the notes on a keyboard sounds the stops belonging to it when pressed down the usual distance. A slightly greater pressure, however, causes, say, the swell keyboard to sound the great organ. By this means remarkable effects can be produced with the utmost ease. The swell-shutter action is electric, and is both prompt and powerful. There are various conjunction pedals, besides a light and a heavy sforzando pedal.

VARIETIES.

THE Maldon Union Rural Sanitary Authority, Essex, at their meeting on May 29, appointed Mr. H. G. Keywood, assistant in the Borough Engineer's Office, Nottingham, as the Surveyor and Inspector of Nuisances, at a salary of 200*l.* per annum. There were seventy-four applications.

THE watch committee of the Tunbridge Wells Town Council have decided that bills or advertisement-boards are not to be allowed to appear on the Pantiles.

A PAPER on "John Dagnia, the Italian glassmaker of South Shields, who died in 1743," was read by the Rev. C. E. Adamson at the last meeting of the Newcastle Society of Antiquaries. The name Dagnia, he said, was a leading one in the Tyneside glass trade in the early part of the eighteenth century. John Dagnia was from 1717 the proprietor of a glass-house, probably at South Shields rather than at Newcastle. There was a tradition that two bevelled panes of plate glass in the garden door of Dagnia's house at Cleadon were the first manufactured in England. Some larch trees in the grounds of the house used also to be pointed out as the first planted in England, the statement being that Dagnia brought fourteen trees from Italy, and that five survived.

THE new school the Mercers' Company are erecting in Barnard's Inn, Holborn, is nearing completion. The quaint old hall of the Inn, which dates from the time of Henry II., is to serve as a dining-hall for the pupils.

AT the Liverpool Town Hall a Local Government Board inquiry has been held with reference to an application by the Corporation of Liverpool to borrow 25,000*l.* for the demolition of insanitary property under the last presentment of the medical

officer of health, by which it is proposed to pull down 578 houses.

FLOUR-MILLS belonging to Messrs. Vernon & Sons, near Uttoxeter, have been destroyed by fire. The damage is estimated at 7,500*l.*

THE death is announced of Mrs. Gray, of Powers Vale, Perthshire, the mother of Lady Millais, at the advanced age of eighty-four. It was from Mrs. Gray's garden that Sir John Millais painted his celebrated picture, *The Vale of Rest*.

THE proposed extension of the Alfred Dock, Birkenhead, with a view to providing additional berth accommodation for large vessels, at an estimated cost of 8,200*l.*, is under consideration by the Dock Board.

THE reservoir at Assouan, as proposed by Mr. Willcocks, C.E., is to be undertaken without delay.

BUILDING AND BUILDERS.

MR. A. B. M'DONALD, the city engineer, has completed the plans for the People's Palace which is to be erected by the Town Council of Glasgow on the Green. It is intended to serve for a museum and gallery of the fine arts and also for a winter garden, in which occasional assemblages of the citizens may be held, floorage accommodation being provided for 3,000 persons. The cost of the works will be about 20,000*l.*

A SANATORIUM is to be erected in Brighton at a cost of over 26,000*l.*, but at first only a part is to be undertaken, which will cost 15,000*l.* A refuse-destructor will also be set up, which will cost at least 14,000*l.*

THE hospital committee of the Liverpool Corporation have adopted plans for an extensive addition to Netherfield Road Hospital. For the land about 7,000*l.* has already been paid, and it is proposed to expend on the new buildings, one of the principal features of which is an isolation ward, about 16,000*l.*

THE chancel of the new church at Avonmouth has just been greatly improved. The wooden steps have been removed, and marble has been substituted. The new steps are the work of Messrs. Arthur Lee & Bros.; they are made of dark Ashburton marble, a beautiful ornamental stone which is quarried in the neighbouring county of Devonshire.

AT the meeting of the Edinburgh Dean of Guild Court there were twenty-seven applications for warrants, of which fourteen were granted. Leave was given to the Edinburgh Merchant Company to effect alterations at the Edinburgh

NOTICE.

N.B.—Perfect Success Guaranteed or No Pay.

Ladies' College, Queen Street, in the shape of heightening the building towards the back lane, to provide more accommodation for sanitary and other purposes. Warrant was also granted to the Governors of Daniel Stewart's College to construct a hall in the courtyard in front of the building. That courtyard is at present enclosed on one side with a handsome open screen in stonework. It is proposed to roof this over, and thus make a large hall 150 feet long and 45 feet wide. The roof will be of iron, and the hall will be used as a gymnasium and recreation hall. The architects are Messrs. M'Gibbon & Ross.

THE Liverpool City Council have passed amended plans for the new baths at the George's Pierhead, the baths committee being authorised, after the quantities are taken out, to advertise for tenders, to select a contractor for the approval of the Council, and to carry out the work at a cost of not exceeding 60,000/.

NOTES ON NOVELTIES.

MESSRS. WRIGHT SUTCLIFFE & SON, of Halifax, in calling attention to their Sutcliffe's patent "Invincible" automatic water-closet and slop-sink, with self-lifting seat, remark that there are millions of gallons of water wasted every day in the larger cities and towns through leaking valve-cisterns, "weeping" syphons or other closet appliances, and therefore they expect this apparatus to prove a great boon to waterworks companies and others, as all leakages are reduced to a minimum, and by the improved alarm pipe opening, which is constructed so as to make secret waste impossible, there is immunity from carelessness, any leakage being immediately detected and remedied. The improved patented construction of the closet basin and seat is to insure an instantaneous and effectual flush as well as a more comfortable sitting posture than any other arrangement. When the seat is pulled down the ball tap opens and fills the water receptacle. After use the seat resumes its original position, and in doing so flushes the closet with the greatest force, insuring a thorough scouring of every part of the basin and trap. The flushing of the closet is not left to the user, as with the generality of closets, but is worked automatically. It works silently, and is supplied direct from the main, and there is no complicated valve gearing to get out of order, and no overhead cisterns or connections are necessary. It dispenses with the use of ordinary valves and cranks, unsightly pipes, wires, chains, &c. There is no difficulty

in the treatment of the wall surface above closet, as heretofore, with this new apparatus. There is no valve except ball tap, which is under complete control for supplying the charge on each occasion of usage. The construction of this apparatus does not necessitate the interference of waterworks authorities, except for stamping the ball tap. Any pattern of ball tap can be affixed to the supply to suit the various requirements. It is ornamental and compact in appearance, sanitary and simple in construction, economical as to first and after cost, and not liable to be tampered with or to get out of order.

CONTRACTING IN EGYPT.

SOME interest has been excited, says the correspondent of the *Times*, by the result of a law suit brought by Mr. Fell, the well-known tramways contractor, against the Egyptian Government for payment of 29,000/ damages because the Government cancelled, in April 1891, his concession for constructing and working the Cairo tramways and sequestered the 2,000/ which he had deposited as caution money. An important part of Mr. Fell's case was his production of the official authorisation of Sir Colin Scott-Moncrieff, then under-minister of public works, for an extension of the time for beginning the work up to March 19, 1891; also two other letters, dated March 18 and 23, stating that Sir Colin Scott-Moncrieff was satisfied that Mr. Fell had begun the work as stipulated. The Mixed Tribunal refused to admit these letters on the singular ground that the original concession having been signed by the minister, Keki Pasha, Sir Colin Scott-Moncrieff, the under-minister, had no authority to grant any modification. The Tribunal, in its judgment, also alludes to the affidavits of several respectable English manufacturers showing that Mr. Fell had bought rails, carriages, &c., as more or less questionable "contestables."

Surprise has often been expressed that English firms so rarely compete for important engineering contracts in Egypt. This is partly because there is an impression that harder measure is meted out to Englishmen than to natives or subjects of other nationalities when contested points arise, but in a greater degree because English manufacturers show less adaptability than their continental competitors for meeting the exact letter of Egyptian requirements. Mr. Fell's case, having been treated in a manner repugnant to English ideas of fair dealing, will tend to accentuate the aversion of English firms for engineering contracts in Egypt.

NEW CATALOGUES.

WE have received from Messrs. T. & R. Boote, of the Waterloo Potteries and Patent Tile Works, Burslem, a copy of their new pattern-book of floor and wall-tiling. It contains twenty-eight large sheets of designs, showing in every case the colouring, the harmonising of colours playing an effective part in the design. These sheets contain over 170 different designs, which have been selected out of many that are too numerous to comprise in the compass of any ordinary pattern-book. This is, however, no ordinary catalogue, Messrs. T. & R. Boote having even surpassed their usual high class standard in respect of illustrations, in addition to the fact that the most lifelike—if the expression may be allowed—representations as are possible of tilework on paper are given. Another advantage is that everything has been drawn to scale. Many of the patterns shown are new in treatment and design—for example, all those shown on sheet 104A and sheet 121. It might save time to mention that sheet 121 will not be found to follow sheet 120, for it follows sheet 104A. Other new designs will be found in Nos. 643, 648, 649, 650, 669, 670, 644, 646, 429, 437, 551, 550, 666, 672 and 642. In quoting the Nos. numerical sequence has not been followed. No. 643 will be found on sheet 100 and No. 642 on sheet 116, the other Nos. being found on intermediate sheets. The new patterns showing dados, fittings and frieze, &c., complete, should also be noticed, as being designed with great judgment to give a beautiful enrichment in thorough character with the material.

ART SCHOOL, DOVER.

LADY CRUNDALL, wife of Sir W. G. Crundall, who is now in his sixth year of office as mayor of Dover, laid the foundation stone of a new School of Art, Science and Technology on Monday, June 4. The school is being erected by the Corporation on a site adjoining the Municipal Buildings in Ladywell, which were designed by the late W. Burges, A.R.A., and carried out after his decease. The present school of art accommodation has proved quite inadequate for the increased number of students who gather under the care of Mr. W. H. East, and the Corporation have therefore undertaken the erection of this new block of buildings, which cannot fail to be of advantage to the town. The contract entered into amounts to 10,278*l*. The builder is Mr. W. Bromley, of Dover, and the architect Mr. John S. Chapple, of 7 John Street, Adelphi, W.C.

STRIKES IN CHINA.

THE Shanghai correspondent of the *Standard*, telegraphing to that paper on Monday, says:—The friends of "labour" and the organisers of paralysing strikes at home may be interested to note how their favourite tactics work in less Liberal countries. The young Emperor of China has just had experience of the inconveniences of strikes, and has initiated a drastic mode of discouraging that evil. Many thousands of artisans, including builders' masons, metal-workers, painters and others have been engaged for months past in repairing the Imperial buildings in Peking, in preparation for the Empress-Dowager's birthday celebrations. Latterly, as the time for the work grew shorter, these people caused much trouble by demanding higher pay and refusing to work when their demands were not immediately satisfied. Accordingly Kuang Hsü, a couple of days since, promulgated an edict dwelling upon the trouble caused by these strikes, and commanding his soldiers and police to arrest every workman employed in the Imperial city who shows the slightest disposition to assert the "rights of labour" in a manner likely to cause inconvenience or to retard the work. The edict proceeds to say that all strikers are to be punished without mercy, no leniency to be shown; the more turbulent disturbers to be tried for high treason, the active ringleaders to suffer death by strangulation, while all who follow them are to be banished to the "fever and mosquito regions" for three years. It is reported that very little enthusiasm is noticeable among the strikers now.

STREET IMPROVEMENTS AND NEW BUILDINGS IN LIVERPOOL.

THE City Council at its next meeting, says the *Liverpool Courier*, will have to consider some important suggestions as to street improvements. The principal of these are in the centre of the city, adjacent to the Exchange and other busy commercial circles, where it is felt that some of the projected alterations are much needed. Great alterations have been made in these localities of recent years, and if some of the projected street improvements and the construction of new buildings are carried into effect it will help further to enhance the appearance of the city, and be of public utility. There will be submitted to the Council by the health committee, who have the initiatory regulation of these matters, a recommendation that the Council, pursuant to the 66th section of the Towns Improvement Clauses Act 1847, allow, for the purpose of improving the line of Water Street and Fenwick Street, the new buildings for the Bank of Liverpool in such streets to be set forward beyond the building line at the corner of Water Street and Fenwick Street to the extent of 15 square feet on the following terms, viz. that the building line in Fenwick Street be set back, and that two steps in Fenwick Street and one in Lower Castle Street be given up, and the spaces, measuring altogether 65 square feet, be added to the streets; also that the Council consent to the construction of two brick pilasters in the first, second and third storeys above the ground storey of the new offices and warehouses numbered 8 and 10 in Vernon Street, so as to project 4½ inches beyond the building line.

There is also contemplated an improvement by which it is purposed to carry out the gigantic task of pulling down an immense block of property and rebuilding it. This block extends from the Commercial Bank and Yates's Bank in Castle Street down to Parr's Bank in Cook Street, taking in Orange Court and all the intermediate buildings, which will be entirely demolished and new and commodious blocks of offices erected in their stead. A curious feature which is in some way associated with these buildings is that they were, or some of them at any rate, erected by the predecessors of the present firm of Messrs. Jones & Sons, who are now building new premises for Messrs. Leyland & Bullins, bankers, on the opposite side of Castle Street. The firm have also had to do with erecting many other important buildings in Liverpool and district. It is estimated that the value of the block of property and land in question is between 230,000*l.* and 240,000*l.* Several attempts

have been made within the past three or four years to form syndicates to purchase the property, but they have all been unsuccessful, although in some cases contracts were actually signed and deposits paid. Terms of purchase have now been arranged by Messrs. Miller, Peel, Hughes & Rutherford, solicitors, of Cook Street, who have got the trustees of the Osmaston settled estates of the late Sir Andrew Barclay Walker, Bart., to find the money required, about 155,000*l.* The property has been purchased freehold on the basis of a syndicate which has been formed in Birmingham, agreeing to take five leases of the property (it being divided into five blocks), and spending a certain sum of money fixed upon in rebuilding or improving each block. The five blocks are each to be fitted with lifts, &c., and to be built on the most modern and improved principle for offices which will open out into a common staircase in Castle Street. One great advantage of having property built in blocks is that the ground-rent or lease of such, when a matter of 20,000*l.* or so, can be more easily disposed of than would be the case where a sum of 200,000*l.* was involved. Another advantage is that blocks could be insured on better terms against fire. It is a subject of great regret that this matter was not taken up by Liverpool people. One would have thought that in a place like Liverpool there were architects and others of sufficient enterprise to endeavour to grapple with it, but it has been found that this was not the case. Efforts were made in every direction to secure local support, but this was not forthcoming, and it was only when the Birmingham gentlemen forming the syndicate came to the rescue that it was found possible to go on with the alterations. The site will be the largest and most important in point of value of any single site in Liverpool for office purposes. The improvements in Castle Street of recent years have been of an important nature, and, as in the case of Lombard Street, London, the shops are being gradually eliminated, and it is becoming the habitat of some of the principal banks in the city, the Bank of England, the Adelphi, Leyland & Bullin, Yates & Co., the North and South Wales and other financial houses having their abodes there now.

The purchase of the property in question was completed a fortnight ago, and the whole of the purchase-money has been paid over, the price of the land being as near as possible 50*l.* per yard, certainly not an excessive price when it is remembered what a splendid frontage the property has to Castle Street and Cook Street. A suggestion has been made that the Law Association should join the gentlemen who are about to rebuild

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

this property, with the object of securing an entrance to their rooms by means of the staircase of one of the new blocks, and the matter is now under consideration. The tenancies of the property are all exceedingly short, and the occupiers have expressed their willingness to meet the views of the builders. The present intention is that the back portions of the property will first be pulled down and rebuilt, so that the tenants of the succeeding portions to be demolished will be able to be accommodated in the new buildings.

One fact which ought not to be lost sight of at this juncture is that the Corporation have now an admirable opportunity of effecting the much-needed widening of Cook Street, and that without having to pay an exorbitant price. Whenever this subject has been broached in the past the rebuilding of the property has stared them in the face, but now the Corporation have an opportunity of doing the work for the mere price of the land, and should they allow it to slip there is no telling when they will again have such a chance.

The syndicate will lease the blocks for a period of ninety-nine years, and while not paying anything for the land will erect the blocks of offices, paying the trustees of the late Sir A. B. Walker's estates 4 per cent. on the 155,000*l.* laid out by them. This system is said to be a entirely new one in business relations in Liverpool, though it has been carried out with advantage in London, Manchester, Birmingham and other places for a good number of years. It simply means that a capitalist can find money for the purchase out and out of a large piece of land and not have the responsibility of rebuilding the property or looking after the tenants, while at the same time he gets a safe and small return for his money. The only matter which now remains to be done in connection with the scheme is giving the tenants notice to quit.

At the meeting of the Bridlington Local Board it was decided, on the recommendation of the building and lighting committee, to light up the sea front from the north end of the Prince's Parade to the north end of the Beaconsfield Sea Wall by electricity, at an estimated cost of 275*l.* The Prince's Parade has been lighted by electricity for the past three seasons, and it has proved such a success that the Board have determined to extend this mode of lighting. Seven arc lamps of 2,000 candle-power each will be used, and supplied from the Board's station on the Prince's Parade

EGYPTIAN OBELISKS.

MUCH learning and research have been expended by Zoëga and others in endeavouring to ascertain the origin of obelisks, yet without throwing any very satisfactory light on that part of the question. Antiquaries have in fact endeavoured to find positive evidence where none was to be obtained, for the case itself is not, like that of a particular invention or discovery, referable to some precise period or nation. On the contrary, from the very earliest ages it had been the practice to mark some particular spot, the scene of some important event, by what might serve as a durable monument of it; nor would anything more naturally suggest itself for such purpose than fixing in an upright position a stone of unusual dimensions. The Bible makes mention of this practice, and it prevailed not only in the East and in the early ages of the world, but has prevailed among nearly all nations either in a savage state or in an early stage of civilisation. Among the Egyptians, therefore, the practice was not otherwise very remarkable than on account of their continuing it, and bringing such simple primeval monuments to great perfection, making them of stupendous dimensions, working them in the most elaborate manner, and adorning them with hieroglyphics, though not indeed invariably, for there are instances of Egyptian obelisks which are not so sculptured; among others that in front of St. Peter's, at Rome, and the one before the church of Santa Maria Maggiore.

Small obelisks were sometimes of sandstone or granite, but the larger Egyptian obelisks are all of the red granite of Syene, and it is certainly astonishing how such enormous masses of that material could be quarried out and afterwards removed and placed in their position. We may conjecture that the Egyptians detached the large masses of rock for their obelisks somewhat in the same way that was adopted by the natives of India on the occasion of raising the great granite obelisk at Seringapatam in the year 1805. In this instance a groove about 2 inches wide and deep was chiselled out by the workmen in the line where it was required to separate the stone which being done, a fire was kindled upon it from end to end and kept up until the stone was sufficiently heated, when the embers were blown off, and cold water poured into the groove, whereby a clear fracture in the stone was made without further labour. Indeed, the mode in which the Egyptians worked their quarries is

clear enough at the present day from an inspection of the excavations. Among the Egyptians, when the block had been thus hewn out of the quarry it was conveyed away by a raft on a canal brought up to the very edge of the rock, either at the time of the inundation, when the water would rise to a sufficient level, or by lowering the block down an inclined plane or platform to the raft, or by digging a canal from the river to the site of the block and bringing a boat under the obelisk, in the manner described by Pliny. The granite block was afterwards polished, and probably raised in the same way as the Seringapatam obelisk, by means of banks of earth.

For raising the obelisk before St. Peter's (supposed to be that brought from Heliopolis by Caligula) no fewer than five hundred different projects were submitted by architects and engineers to the pope Sixtus V., and Domenico Fontana was thought to have accomplished little short of a miracle in rearing it by means of very complex machinery and several hundreds of workmen and horses. The process by which the Lateran obelisk was originally erected at Rome seems to have been equally complicated and laborious. How the Egyptians raised such masses of granite is not known, but probably by a much simpler mode, whether similar or not to that practised in elevating upon its pedestal the one at Seringapatam. According to Colonel Wilks's account of the operations this obelisk, a single stone about sixty feet long and six square at its base, was placed horizontally upon a mound or platform of earth, secured by strong walls and level with the top of the pedestal, the base of the obelisk being placed just on the ledge of the pedestal. The shaft having been laid on planks or timber poles, these served as fulcra, by means of which the smaller end or top was gradually raised, wedges were put under it and earth rammed in, which was repeated until the platform became an inclined plane as steep as it could with safety be carried up. The shaft being got thus far out of its horizontal position towards a perpendicular one, ropes were then applied, worked from a strong timber scaffold nearly as high as the obelisk itself and enclosing the other three sides of the pedestal, other ropes being also employed in a contrary direction in order to check its coming down on the pedestal with too sudden a shock.

By the Egyptians themselves obelisks do not appear to have been raised as insulated monuments or single objects, but as the accompaniments to temples and palaces, where they were placed in pairs, that is, one on each side of a large entrance, or *propylea*, and it may therefore be inferred that some particular

signification was attached to them. They were also sometimes placed in the interior courts of temples. With respect to their proportions, the shafts of obelisks were usually about ten diameters in height, and one-fourth narrower at top than at their base. The pyramidion, or apex, was made much more pointed in some obelisks than in others. One singularity is that few Egyptian obelisks are perfectly square, two of their sides being generally somewhat broader than the other two, which may be accounted for by what has just been said, namely, that they were placed against buildings, and not intended to be insulated objects viewed from every direction. The face of an obelisk is sometimes slightly convex, instead of being quite plain, as is the case with one side of the Lateran obelisk.

The number of obelisks in Egypt must have been at one time very considerable, yet we are not therefore to suppose that the erection of them was a frequent circumstance, since, once formed, they were almost imperishable, and would therefore greatly increase in the course of ages. Many that are still remaining are no longer standing, and in some places several have been found on the same spot, some still standing, others lying on the ground. When the Romans became masters of Egypt they removed many of these monuments to their own capital, among others that of the Lateran, which is the largest now known, its shaft being 105 feet (although it has been reduced, a portion at the lower part having been cut off in consequence of being fractured), and two of its sides 9 feet 8½ inches, the other two 9 feet. This obelisk was first conveyed from Heliopolis to Alexandria by Constantine, and by that emperor's son Constantius brought from the latter city to Rome, where it was erected in the Circus Maximus. The shaft of the Lateran obelisk weighs about 445 tons in round numbers. Augustus also had previously brought two from Heliopolis. That which was originally placed in the Vatican Circus by Caligula, and now stands in the piazza of St. Peter's, is next in size to that of the Lateran, though supposed to have been somewhat abridged of its original dimensions. The entire height, including the pedestal and the ornament at top, is about 132 feet; the shaft itself is 83 feet, and 8 feet 10 inches square at its base and 5 feet 11 inches at the other end. In the At-Meidan at Constantinople there is an obelisk about 50 feet high, said to have been erected by the emperor Theodosius.

During the calamities that befel Rome under its barbarian invaders after the downfall of the empire, the obelisks were damaged and overthrown, but they have been gradually restored under various pontiffs.

32 King Street, Cheapside, E.C.

ESTABLISHED 1860.

THE INSTITUTION OF CIVIL ENGINEERS.

THE annual report of the Council of the Institution of Civil Engineers shows an effective increase of 188 additions on the previous total of 5,371—or at the rate of $3\frac{1}{2}$ per cent. per annum—while as regards the students, the decrease is 28. The gross numbers on the books on March 31 in 1893 and in 1894 were 6,397 and 6,557 respectively.

The strict income amounted to 21,308*l.* 12*s.* 3*d.*, an increase of about 45*o*l. on the former year, to which had to be added 3,838*l.* 16*s.* on account of capital and 428*l.* 14*s.* 6*d.* for trust funds, bringing up the total receipts to 25,576*l.* 2*s.* 9*d.* The general expenditure had been 17,489*l.* 3*s.* 10*d.* (including 8,050*l.* for publications), while there had been an expenditure of 5,166*l.* 1*s.* 2*d.* on capital account and 10,000*l.* had been placed on deposit to meet the considerable sums which would be required at an early date in connection with the new building. The summary of investments showed that there stood to the credit of the Institution 118,067*l.*, with trust funds of the par value of 15,606*l.* 0*s.* 10*d.*, together 133,673*l.* 0*s.* 10*d.*

During the past session nineteen papers had been read and discussed at the ordinary meetings, treating of separate and clearly defined branches of engineering—municipal, hydraulic, mechanical, mining and electrical, and also referring to naval architecture. For several of the papers detailed premiums had been awarded to Messrs. Clerke, Kreuter, Vernon-Harcourt, Partiot, Greathead, Fox, Parker, Hunt, Redwood, Commans and Colquhoun. The papers selected for printing without being read had been numerous and varied, and had ranged over the whole field of modern engineering. Mention was made of several representative memoirs in the various branches, not that they merited greater recognition than the others, but that they served to support the quality of catholicity claimed for the Institution. Premiums for papers in this category had been awarded to Messrs. Donkin, Lowcock, Marks, Tanabe, Ewart and Moncrieff.

The second of the "James Forrest" lectures had been delivered by Dr. John Hopkinson, F.R.S., M.Inst.C.E., his theme being "The Relation of Mathematics to Engineering." This recondite subject had been presented to a large audience, which testified in a marked manner its appreciation of the lecture.

Eleven supplemental meetings for students had been held. The papers read afforded evidence of having been carefully prepared, and three of them were considered sufficiently good to merit the distinction of being printed in the minutes of proceedings. The proceedings of the local associations of students at Manchester, Glasgow, Birmingham and Newcastle-on-Tyne had been highly satisfactory, and the Council was glad to report that a fifth local association had been formed at Leeds. For papers read by students at the Institution, and before the local associations, the Council had made the following awards:—The Miller scholarship (tenable for two years) to Mr. L. H. Appleby, and Miller prizes to Messrs. A. R. Gale, W. Beer, W. G. Wales, H. T. White, P. J. Tucker, H. N. Allott, A. Watson, W. O. Leitch and T. H. Watt.

At the Engineering Congress at Chicago, alluded to in the last report, the Institution had been represented by Sir Benjamin Baker, K.C.M.G. An address, thanking the Institution for its action in the matter, had been subsequently received from the executive committee of the Congress. The Council was of opinion that to preserve and strengthen the cordial relation which subsisted between the engineers of Great Britain and of the United States was a high object, for the attainment of which in the present case the thanks of the Institution were due to its delegate.

The laborious work of preparing for press the library catalogue had been completed. A large portion of the matter was already in print. The sheets of the first volume had been struck off, and a bound copy was laid on the table for the inspection of the members.

In conclusion, the Council stated they had devoted much attention to the question of rebuilding the premises. A decision had been arrived at to utilise the sites of Nos. 24, 25 and 26 Great George Street, and designs for a new building had been prepared by Mr. Charles Barry, F.R.I.B.A. It was hoped that the work might be commenced early in the forthcoming recess.

The ballot for Council resulted in the election of Sir Robert Rawlinson, K.C.B., as president; of Sir B. Baker, K.C.M.G., Mr. J. W. Barry, Mr. W. H. Preece, C.B., and Sir Douglas Fox as vice-presidents; and of Dr. W. Anderson, A. R. Binnie, W. R. Galbraith, J. H. Greathead, Sir Chas. A. Hartley, K.C.M.G., J. C. Hawkshaw, C. Hawksley, Dr. Alex. B. W. Kennedy, Sir Bradford Leslie, K.C.I.E., J. Mansergh, Sir Guilford Molesworth, K.C.I.E., Sir E. J. Reed, K.C.B., W. Shelford, F. W. Webb and Dr. W. H. White, C.B., as other members of Council.

POWER DISTRIBUTION BY ELECTRICITY, WATER AND GAS.*

FOR some time past the author has been struck by the great discrepancy between theory and practice that must exist in the working of electric generating plant in central supply stations where steam is used. Observation and experience alike have served to accentuate the inefficiency of electric generating plant, and some rough comparisons made with other modes of producing and distributing power have led him to go into the matter more carefully, and when invited by Mr. Worby-Beaumont to contribute a paper to your Society, he not only felt honoured at such a request, but was glad of an opportunity of bringing this matter before engineers for discussion. Such a subject as the distribution of power admits of practically endless elaboration. Moreover, nothing can be gained by generalisations from the results of existing or proposed distributing systems. The proper value of each system is entirely conditioned by the initial form in which energy is available, and by the final form in which it is required.

As one of the most important developments of modern engineering lies in the application of electrical energy to lighting, this latter will be considered as the final required form of energy, and coal will be taken as the initial form in which energy is available. These conditions apply to nearly all large towns.

In the following lines the author proposes briefly to consider:—1. The efficiency of electric-generating plant in central stations at the present day. 2. The efficiency of power-producing plant in hydraulic power stations. 3. The efficiency of gas-engines for production of power.

The definitions of efficiency are probably more numerous even than those of "load factor," and no doubt the ingenuity of that class of investigator which seeks to make a labour of investigation is not yet exhausted in the direction of finding out new possible ratios; but in such a paper as this, which is designed more to suggest a line for discussion than to deal with any discoveries or startling novelties, it is well to briefly consider which definition of efficiency is best calculated to serve the purpose of this paper.

The efficiency with which the practical engineer has to deal may be expressed—perhaps with brutal matter of factness—as the ratio of what you get to what you pay for. But while such definition expresses the main value of a combination of machines commercially, it is not a convenient ratio for comparison with other similar ratios, because the introduction of market value at once destroys the possibility of bringing each fraction to a common denominator. As the motors that will be considered to-night are all heat machines, the author proposes to base his comparisons upon the ratio of the thermal equivalent of useful work available for commercial purposes to the calorific value of the fuel burnt per hour. Such considerations as the cost of fuel can easily be applied after.

This definition, however, is open to the objection that it is not fair. It may be argued that if a heat machine of necessity rejects a large proportion of the heat it receives, it is not just to calculate an estimate of efficiency upon a basis which is impossible of realisation, and that the efficiency should be expressed by the ratio of useful work to maximum possible useful work in that class of heat machine. The author would submit that while such a contention bears the semblance of justification, it should be borne in mind (1) that the fact of a machine necessarily rejecting a large proportion of the heat received cannot be pleaded as a valid reason why such a proportion of heat should be rendered unavailable, (2) that the definition adopted by the author gives an absolute basis for comparison, (3) that as long as the meaning attached to the word efficiency is quite clearly understood, it can make no difference to the argument if the actual, instead of the ratio of the actual to maximum theoretical efficiency is used, (4) that the latter is merely one of the very numerous definitions of efficiency.

A steam-engine is usually accounted an extremely wasteful heat machine, but this is, strictly speaking, not the case.

The only way to increase the efficiency of the steam-engine is by lowering the lower limit of temperature, but directly efforts are made in this direction a limit is soon reached beyond which further lowering of the temperature not only ceases to be productive of any good, but is productive of evil. In short, it may be said that all the heat developed in the combustion of fuel is utilised by the steam-engine, either in doing work or in providing the means of doing work or controlling the rate at which work is done.

The efficiency of the steam-engine and boiler combined is not difficult to determine; it is the ratio of the thermal value of the brake horse-power hour to the calorific value of the fuel consumed per brake horse-power hour.

* A paper by Mr. Ed. C. de Segundo, read at a meeting of the Society of Engineers on June 4.

The efficiency of the gas-engine and its equivalent of steam-boiler requires some investigation.

A ton of coal, according to Mr. Emerson Dowson, may be taken to produce 9,500 cubic feet of gas and 1,500 lbs. of coke, of which about 400 lbs. will be consumed under the retort. Assuming that coal having a calorific value of 14,000 thermal units per lb. is used, and taking the calorific value of coke at 10,000 thermal units, the number of thermal units liberated from the ton of coal is (neglecting heat necessary to raise the mass of coal to the temperature of the retort),

$2,240 \times 14,000 - 1,500 \times 10,000$, or 16,360,000 thermal units. Of the heat developed by the consumption of the coke under the retort a large proportion can never be expected to reappear in the gas. But 16,360,000 thermal units have actually disappeared in producing 9,500 cubic feet of gas; hence $\frac{16,360,000}{9,500}$, or 1,722 thermal units, should be accounted for per cubic foot of gas.

Professor Kennedy, Professor Unwin and others have made calculations of the calorific value of a cubic foot of gas, the results of which agree fairly. The average calorific value of London gas may be taken as 620 thermal units per cubic foot at 55 deg. Fahr., and at a pressure of 14.7 lbs. per square inch; hence the efficiency of the gas-generator is $\frac{620}{1,722}$ = about 35 per cent.

The function of a steam boiler is in the case of a gas-engine split up into two, one portion is done at the gasworks and the remainder in the cylinder of the engine itself. Now about 24 per cent. of the heat given to a gas-engine is turned into indicated power, or in the case of a large-size engine about 20 per cent. is converted into brake horse-power. Hence the real efficiency of the gas-engine and boiler, so to speak, is about 7 per cent. The efficiency of a non-condensing steam-engine consuming 2 lbs. of coal of a calorific value of 14,500 thermal units, and working at 80 per cent. mechanical efficiency, is 8.72 per cent., so that the total efficiency of one machine is very much the same as that of the other on this basis of argument.

But Mr. Dowson claims to produce one brake horse-power hour for 1 lb. of anthracite by using his generator gas. This (taking the calorific value of anthracite at 16,000 thermal units per lb.) would correspond to a total efficiency of nearly 20 per cent., an efficiency which the steam-engine and boiler can never hope to reach.

Although the author desires to consider the two heat machines on the basis of what may be termed the useful efficiency, namely, the ratio of available power or brake power to power equivalent of fuel burnt, still, in the face of so great a difference as the foregoing, it may be of interest to inquire into the reason of the difference, and to do this it is necessary to consider another efficiency, namely, the ratio of heat turned into work in the cylinder, to the maximum theoretically possible. This latter quality is expressed by Carnot's Law as the ratio of the difference of temperature at which heat is received and rejected to the absolute temperature at which the heat is received. In the case of the steam-engine this ratio is not difficult to determine, because the heat is all received at one temperature and rejected at one temperature. But in the case of the gas-engine this is not so. As mentioned before, part of the function of the boiler, or part of the operation of calling into existence the working fluid whereby heat energy may be transformed into mechanical energy, is performed in the cylinder of the engine itself. This operation cannot be instantaneous, in obedience to physical laws, therefore the heat is received during an appreciable interval of time and at temperatures varying from the temperature of the mixture and the end of compression to the maximum temperature reached by the charge after explosion. In some parts of the cylinder this temperature may, according to Mr. Clerk, be as high as 3,400 deg. Fahr. It would appear, however, that most authorities agree upon 2,700 deg. Fahr. as about the maximum temperature reached by the charge in gas-engines of all forms.

The temperature of the discharged products is not far short of 800 deg. Fahr., though of course the heat rejected is not rejected at one temperature. Hence the maximum efficiency attainable should be $\frac{2,700 - 800}{3,160} = \frac{1,900}{3,160}$ = 60 per cent.

The efficiency of the non-condensing steam-engine cylinder under an admission pressure of 130 lbs. per square inch, and an exhaust pressure of 20 lbs. per square inch would be about 18 per cent. Therefore if this steam-engine turns 8 per cent. of the heat into work, it is doing as well relatively to its peculiar limitations as the gas-engine that turns 26 per cent. of the total heat received into work.

The greater useful efficiency of the gas-engine therefore must be ascribed to the nature of the vehicle used for carrying the heat, and not to the superiority of the gas-engine as a heat machine.

It is not within the scope of this paper to even suggest any

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

any proposed or existing building. All difficulty in the employment or transmission of power to any part of a Building, where ever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Wetzel's Patent). Besides this it facilitates distribution of effect, and is extremely economical in working. HEAD OFFICE:

63 FORE STREET LONDON E.C. Branches at Manchester Bradford Bristol and Glasgow.

direction in which the efficiency of the gas-engine might be enhanced, but it is obvious that if the link could be forged between the now disconnected heat chain in the gas-engine cycle, whereby the heat carried away in keeping down the temperature of the cylinder could be usefully expended in some other part of the cycle, the time would not be far distant that Sir Frederick Bramwell has spoken of, when all that remains of the steam-engine would be a working model or two in some obscure museum.

Let us now consider an electric generating plant using steam power.

Tests of various portions of electric generating plant are continually being published which, if they are any criterion of what may be attained in practice, would point to an extremely high efficiency of a generating station as a whole. Any dynamo manufacturer would be much insulted if one were to suggest that his 30 kilowatt machine would not yield a commercial efficiency of over 90 per cent. at anything like full load. The makers of high speed, non-compound, non-condensing engines claim a mechanical efficiency of something like 90 per cent. with a steam-consumption of 18 lbs. 1 horse-power hour, or 20 lbs. per brake horse-power hour, and moreover they are always prepared to prove it.

Only a few weeks ago Messrs. Siemens published an account of a test of a steam dynamo driven by a Willans engine, which resulted in a combined efficiency of 88 per cent. It is also possible to obtain boilers which will evaporate over 12 lbs. of water from, and at 212 deg. Fahr., per lb. of good coal. Now it may be interesting to compare the best possible results based upon such efficiencies. Take a pound of coal whose calorific value is, say, 14,500 thermal units. The author is given to understand that certain boilers in one of the electric generating stations in London evaporate 12.8 lbs. of water from, and at 212 deg., per lb. of coal. This would correspond to an efficiency of about 75 per cent. Allowing 30 per cent. for loss in transmission and radiation, and 13 per cent. as the highest thermal efficiency of a non-condensing, high-speed steam-engine using 18 lbs. of water per indicated horse-power hour, this would leave 1,372 thermal units turned into work in the cylinder of the engine.

Taking 88 per cent. as the efficiency at which a steam dynamo was recently described to be capable of working, 1,207 thermal units, or nearly 350 watt hours should reappear at the dynamo terminals, and subtracting 10 per cent. for loss in distribution, 315 watt hours should be paid for by the consumer per lb. of coal burnt at the station. This is equivalent to a consumption $\frac{1,000}{350} = 2.86$ lbs. of coal per unit delivered.

Were a full load to be maintained at a generating station, this result is what should be realised if the efficiencies claimed for the various factors are trustworthy. But nothing approaching this figure is attained in central station work, and the whole of the discrepancy is attributable to the influence of a load factor. In all, eight definitions have been given of the term load factor. In the considerations under review the author takes the following definition, namely, the ratio of total output to safe maximum output for which the plant is designed. It will be interesting to compare existing practice with the result obtained by assuming efficiencies, &c., which may be reasonably considered to accompany the working of a plant under the ordinary working conditions in England.

In a modern generating station the sizes of the generating units should be so proportioned and the general arrangements so designed as to enable a careful man to keep the load on those of his units which are running at a minimum of from 50 to 60 per cent. of full load. This means that on the average the units in work will run at something considerably over half load. From calculations based on the results of actual practice the author has arrived at 9.5 per cent. as the ratio of thermal equivalent of watts at the dynamo terminals to heat contained in steam supplied which should obtain in a well-regulated central station under ordinary conditions of working in England.

Taking, as before, 1 lb. of coal of a calorific value of 14,500 thermal units, allowing a boiler efficiency of 70 per cent., 10 per cent. stand-by losses, 9.5 per cent. efficiency of steam dynamo and 10 per cent. loss in distribution, not more than about 4.4 lbs. of coal should be consumed per kilowatt hour, delivered to consumer's terminals.

But this figure is not approached in practice, except in one instance by Mr. R. E. Crompton, who states that at Kensington Court he burns 5.5 lbs. of coal per kilowatt hour delivered all the year round; but he states that in doing this he forces his boilers, although it is not easy to appreciate the exact meaning of forcing a boiler. Certainly, forcing a boiler usually results in a greater evaporation at a greater consumption per lb. of water evaporated, as it is well known that a boiler works most economically at about three-quarter load.

Professor Kennedy has obtained some very good results in the generating stations of the Westminster Electric Supply,

but not approaching the figure above arrived at. M. Druitt Halpin stated, in the course of some remarks at Nottingham last year, that an analysis of the Board of Trade returns of electric-light companies showed an evaporation per lb. of coal of only 4 lbs. of water in the best example and of 1 or less than 1 in the worst. This anomaly is difficult to account for; it is usually ascribed to a low load factor, but this hardly seems reasonable.

Take, for instance, the working of a station of the London Hydraulic Power Company. The plant consists of boilers, engines and pumps combined, and accumulators which in practice only act as equalisers. The efficiency of the boilers, the stand-by losses and the loss by radiation will be about the same as in the case of an electric generating plant, at least, there is no reason why they should be different. But the engines will probably be more economical because, although they run at a diminished speed where the demand on the mains is small, they always work at full load per revolution. Of course the engine efficiency is not quite so good at slow speed as at high, but even at a slow speed an engine working at full load per revolution must compare favourably with one doing the same total work in horse-power hours at double or three times the speed. Moreover, at an hydraulic power station it is generally practicable to use triple expansion condensing engines.

As the thermal efficiency of steam-engines, under such working conditions as obtained in central power producing stations, is extremely difficult to determine with any accuracy, it may be of interest to arrive at their figure by calculation of other efficiencies as nearly as they can be estimated.

Probably 9 lbs. of coal of calorific value of 14,500 thermal units per lb. is not an excessive figure to assume as the average performance of London central electric stations per kilowatt hour, paid for by the consumer.

Now one kilowatt hour is equal to about 3,420 thermal units. Adding 11 per cent. for loss in distribution, and allowing 1.25 as the counter efficiency of the dynamo, there should appear on the crank shaft of the engine, so to speak, the equivalent of about 4,750 thermal units. But to effect this 9 lbs. of coal have been burnt, liberating $14,500 \times 9 = 130,500$ thermal units, so that the efficiency or non-efficiency of working of boiler and engine together with attendant stand-by and radiation losses are responsible for 96.2 per cent. of the heat energy of the coal consumed.

Of course the engine and boiler as heat machines are not to be held accountable for the whole of this loss. It is mainly due to the conditions of working. But the question that naturally suggests itself under these circumstances is, is there no other and more efficient manner of generating and distributing light and power on an intermitting demand than by steam power, generating electrical energy and distributing it by means of copper mains?

It must not be forgotten that the coal consumption is by no means the only factor to be considered. Rents, rates and taxes, maintenances and distribution expenses, depreciation, management expenses, and a host of other items, have to be tacked on to the cost of coal consumed before the figure is reached from which profits can be calculated. But even on this basis the total for power delivered is strikingly smaller in the case of hydraulic power supply than in that of electric supply.

In a recent paper read before the Institution of Civil Engineers by Mr. E. B. Ellington, it was stated that the total cost per 1,000 gallons delivered at 700 lbs. per square inch was 12s. 6d. Now 1,000 gallons at 700 lbs. per square inch is equivalent to 8.34 horse-power hours or 6.25 kilowatt hours nearly. There is no Electric Supply Company in London who deliver one kilowatt hour at a less total cost than from 3.5 to 4.5d. to themselves. Thus the cost per equivalent of one kilowatt hour is rather more than double in the case of electric supply than in the case of hydraulic supply. The question is, as to whether this economy can be ascribed wholly to the superior economy of the steam-engine in all hydraulic power stations, having regard to the fact that not only is the hydraulic load curve similar in form to the electric load curve, but the load factors in both cases are similar. The author thinks not entirely, as a certain proportion of this economy must be due to the difference in the inevitable losses in the system of distribution, and also to the difference in capital outlay for large powers.

In comparing distribution of power by high-pressure water and by electricity, due consideration must be had to the purposes to which power is to be put. For working lifts or cranes or presses, it is doubtful whether any simpler and better means could be provided in a city like London than water-pressure. If, on the other hand, the form in which the power is delivered has to be changed before it can be applied, it is quite possible that the efficiency of transformation may be so low as to dissipate the economy attained in generation and distribution. Compare, for instance, the number of transformations necessary

		80 p.c.	Motor.

Of the 14,500 thermal units liberated by 1 lb. of coal 1,044 thermal units would reappear as useful work on the hydraulic system and 478.5 thermal units on the electric system.

ELECTRIC LIGHTING.

Efficiency.	Hydraulic Power.	Efficiency.	Electric Power.
70 p.c.	Boilers.	70 p.c.	Boilers.
13 p.c.	Compound condensing engines.	9 p.c.	Non-condensing engines.
80 p.c.	Pumps.	80 p.c.	Dynamos.
99 p.c.	Distributing system.	82 p.c.	Distributing system.
66 p.c.	Motor.		
90 p.c.	Dynamos.		

On the hydraulic system about 620 thermal units should reappear in useful work and on the electric system about 650 thermal units.

The foregoing assumptions are not made with regard to any particular load factor, but as the load factor is found to be very similar in public electric supply stations and public hydraulic supply stations, the conclusions indicated by the figures should not be materially altered. There is of course nothing very new about this result, but it is sufficiently striking to have induced a Belgian engineer of considerable reputation to devote a large amount of time to the development of a system of hydraulic distribution in generating electrical energy which should enable electrical energy to be sold at considerably cheaper rates than at present.

It is unnecessary to discuss M. Van Rysselbergh's scheme in detail. It is evident that the only directions in which the efficiency of a system as a whole can be increased are (1) by decreasing the number of transformations of energy, and (2) by increasing the efficiency of either or all of these.

Now the number of transformations of energy is not

decreased but increased in the hydraulic system. The efficiency of boilers and dynamos cannot be very different in both systems. The difference in the cost of the distributing system is conditioned by circumstances; there remain then two efficiencies to be improved on, the efficiency of the engine and the efficiency of the distributing system.

The economy effected by a triple expansion condensing engine working as it does in an hydraulic power station at full load per stroke, over the steam engines forming part of the "steam dynamos," now much used in electric generating stations, might well reach 50 per cent.—that is to say, where the steam engine of the steam dynamo gives 10 per cent, the triple compound as above might yield 15 per cent. The loss in a mile of hydraulic main, say 6.5 inches diameter, when transmitting 100 horse-power at 700 lbs. per square inch at a velocity not exceeding 3 feet per second, would not greatly exceed 1 per cent., whereas the average loss in an electric distributing system rarely is less than 12 per cent., though doubtless this could be improved upon.

Against these sources of economy must be placed the loss in the water motor, the loss in the extra transformation of motive power into electric light, and the loss in the low-tension network surrounding each distributing station. Further, hydraulic mains have to be placed at a considerably lower level than the electric conduits need be for many reasons, and it can scarcely be even a matter of doubt that the total commercial efficiency of the whole hydro-electric system, by which is meant the useful efficiency modified by all such considerations as rents, rates and taxes, maintenance and depreciation, &c., will compare unfavourably with the total commercial efficiency of direct electric supply.

There can be no doubt, however, that power can be produced and delivered hydraulically at a smaller cost than the electrical equivalent electrically. There must be a reason for this, and the reason is not far to seek. In the hydraulic power station a more efficient engine can generally be used; then this engine can be worked more efficiently owing to the fact that although the engine may vary in speed, it works always at full load to the stroke. There can be further a much greater efficiency in distribution through pipes. In hydraulic power supply the pressure is not a function of the speed of the pump (as in direct electric supply it is a function of the speed of the armature), but the pressure in the mains is maintained outside of the engine and pump, which only deliver enough water at a constant pressure to supply the demand on the mains.

LOSSES PAID OVER
£20,000,000.

At first sight it seems easy to apply this principle to electric supply by the introduction of an electric accumulator or storage battery to keep up the pressure on the mains. But unfortunately the analogy between an hydraulic and an electric accumulator is not quite complete; it breaks down in one important detail, namely, that while the hydraulic accumulator reacts in the same way upon both main and pump, the electric accumulator only acts in an analogous manner towards the main. Its effect upon the dynamo or electric pump is to drive the pump unless the pump is driven sufficiently quickly. What is wanted to complete the analogy is the analogue of the non-return valve, and this so far has not been discovered. Moreover, while pressure can be exerted by a pump, whose plunger is stationary, the pressure exerted by the electrical pump or dynamo is a function of the speed of rotation of the armature. Thus in order to supply a small demand the steam-engine of an electric generating station has to work at about 90 per cent. of the speed required to supply the full demand.

There is no reason why an electrical generating station should not be able, provided the demand is sufficiently large and varied, to so apportion its generating units as to keep each unit in work loaded to 90 per cent. of its full load, in which case the only losses in the station would be 10 per cent. stand-by in boilers, radiation, &c. In the Berlin central station, where, owing to Continental habits of life, the demand is more favourably distributed over the twenty-four hours, such a condition is very nearly approached.

(To be concluded.)

DUMBARTON CASTLE.

RECENTLY, while a flower plot was being formed on a bank a little behind the old Governor's House, now occupied as the barracks of the four or five men who form the whole garrison of this Union fortress, Mr. Roberts, who was at work there, was surprised by striking against a large stone; he endeavoured to lift it, but it slipped from his hands and fell into what was evidently a large cavity. Major Martin, Royal Engineers, communicated at once with the Glasgow Archaeological Society, and the hon. secretaries visited the castle. They found on examination that there were no traces of an underground passage, but that the cavity unexpectedly brought to light was a large cistern about 15 feet long, 9 feet high and

8 feet wide, having a dwarf division wall in the middle, with an arched opening in the lower part of it. It is curious that there appears to be no local tradition of any such cistern, although it is evidently of comparatively recent construction, not dating back probably more than seventy or eighty years.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TRADE NOTES.

THE new schools, Potter Heigham, are being warmed and ventilated by means of Shorlands' patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

At the monthly meeting of the Glasgow School Board, Mr. Boyd gave notice that at the next meeting he would move that all specifications inviting tenders for work should contain a clause binding the successful firm to pay the workmen not less than the standard rate of wages in the district, and that no firm should be allowed to sub-contract.

IN connection with the Merionethshire slate mines a departmental committee appointed by the Home Office have visited Belgium and the North of France to inspect the slate quarries of those countries, with the view to reporting upon the mode of working, the appliances used, the way in which the

slates are dressed, the hours worked and the rules in force for the prevention of accidents.

THE directors of the Aberdeen Tramways Company have accepted the contract of Messrs. John M'Adam & Co. for the execution of the works in connection with the proposed extensions, which will consist of the doubling of the line in George Street from Loch Street to Kittybrewster, the extension of the line from Bloomfield to Bridge of Dee, and the repairing of the Kittybrewster track. The cost of the scheme is estimated at about 20,000*l*.

BUILDING AND BUILDERS.

THE new buildings attached to the medical school of St-Thomas's Hospital, containing a students' club and laboratories, were opened by the Duke of Connaught on Saturday last. They cost about 16,000*l*. His Royal Highness said, "I must congratulate the architect, Mr. Currey, on the very handsome proportions of this fine building. It must have been a work of difficulty with this huge hospital so near to make a building which should be in harmonious keeping with the rest."

At the meeting of the Barnsley Town Council, plans for erecting the Kendray Fever Hospital by building fever wards at a cost of 1,600*l*. were approved, and tenders for the work ordered to be obtained. Mr. John Hood's tender for making up Brinckmann Street, 866*l*. 3*s*. 6*d*., was accepted.

At a meeting of the Pershore Sanitary Authority a letter was read from the Upton-on-Severn Authority suggesting that a committee of the Pershore Authority should confer with their committee as to the advisability of erecting a joint hospital. A committee for the purpose was appointed. It was stated that the tramp who had the smallpox last year, and was isolated in a hospital tent, cost the Authority altogether more than 200*l*.

At Matlock the Duke of Devonshire has just opened a new suite of baths, and the Duchess attended a floral fête in aid of the Derbyshire Convalescent Home. His Grace made two speeches, referring to the value of hydropathy and the benefit of hospital treatment.

At the meeting of the executive committee appointed in connection with the Aberdeen University buildings extension scheme, a statement submitted showed that the total cost of the extension was now estimated at 140,000*l*; the money received including 40,000*l*. from the Government, amounts to about

Reading Cases for the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

90,000%, and there is thus a sum of 50,000% required for the completion of the scheme. It was resolved to issue an appeal for additional funds.

A GRAND hotel is to be built at Clacton-on-Sea, and a company formed for the purpose of carrying out the scheme.

PROBATE of the will of the late Mr. William Gibson, builder, Warrington, leaving personal estate of the value of 41,515*l.* 8*s.* 5*d.* has been granted.

THE fourth annual report of Dr. Ralph Copeland, the Astronomer-Royal for Scotland, gives a detailed account of the progress made with the new Royal Observatory on Blackford Hill. Up to March 31, 1894, the sum expended on the buildings at Blackford Hill was 20,364*l.* 6*s.* 9*d.*, exclusive of the outlay on the wire fence, drains and water-supply.

AT the holding of the Glasgow Dean of Guild Court, warrants were granted to the magistrates and council of Glasgow to erect seven tenements of shops and dwelling-houses in Saltmarket and Parnie and Chisholm Streets; the trustees of St. Silas's Episcopal Church, to erect mission-hall and porch in Park Road and Eldon Street; Archbishop Eyre, to erect an additional storey to the Roman Catholic School in Main Street, Maryhill.

ELECTRICAL.

WE are informed that the tender of Messrs. J. G. Statter & Co., 68 Victoria Street, S.W., has been accepted for the electric crane and generating plant at the works of Messrs. C. H. Glover & Co., Hatcham Saw Mills, S.E., to whom Mr. E. R. Dolby, of Westminster, is acting as consulting electrician.

THE Edinburgh Town Council, it is reported, have received estimates for the new electrical station at the West End, and that the lowest amounts to 18,000*l.*, which is 8,000*l.* above the prospective estimate laid before the committee by the burgh engineer.

AT the meeting of the sanitary committee of the Leeds Corporation the question of erecting boilers of 550 horse-power at the Meanwood Road destructor was considered. The matter was brought before the committee by the city engineer (Mr. Hewson), and it was pointed out that boilers of the power suggested might be utilised for the purposes of electric lighting for the municipal buildings, or for electric traction or cable traction on the tramways. A sub-committee was appointed to consider the question.

THE question of the erection of a refuse-destructor for Moss Side has occupied public attention for some time. At the latest meeting of the inhabitants Dr. Wahlutuch, as a medical man, expressed his opinion that burning was the most effective means of destroying refuse, but he was afraid that sufficient heat would not be generated in the destructor to prevent a nuisance. In the ordinary case it would be felt over the radius of a mile. It was perhaps worth considering whether a perfect destructor at a larger cost should not be erected in a proper place, capable of generating a degree of heat sufficient not only thoroughly to destroy the refuse but provide energy to drive a dynamo which would supply the district with electric light. It was resolved that a deputation should be appointed to wait upon the Local Board to represent the feeling of the district.

THE chairman of the electricity committee of St. Pancras Vestry (Mr. A. Sweet) has just made his annual report to the vestry. He described the past year's business as satisfactory. The total income was 15,022*l.*, sufficient to clear off the deficit of the first year—1,543*l.*—and, after paying all the working expenses, and 927*l.* in maintaining the works in the highest state of efficiency, to leave a balance of 4,669*l.*, out of which interest and repayment of loans had been met. The extension now nearing completion at Stanhope Street Station, and the station in course of erection at King's Road would, it was hoped, be in working order and available by next winter. The ratio of cost for public lighting for the year by electricity, as compared with gas, was high, but the charge of 6*d.* per unit made for public lighting was certainly less than a company would charge under similar conditions, and from Michaelmas next the charge would be reduced to 5*d.* per unit. The supply of electricity to private houses, though not large, was promising, as the number of consumers had doubled during the year.

LAST week a large company assembled at the Croydon Clock Factory for the purpose of witnessing the casting of the large hour-bell for the tower of the new municipal buildings, which are being erected at a cost of 100,000*l.* The bell will weigh 36 cwt. It was mentioned as an interesting fact that the metal used on this occasion, or the greater part of it, had for eleven years done duty as a bell on the Eddystone Lighthouse. A siren is now employed on the lighthouse, and the two bells, each weighing 2 tons, have returned to Croydon, where they were cast, the Trinity House authorities having sold them to Messrs. Gillett & Johnston.

THE *Leeds Mercury* of the 13th inst. in a short paragraph gives a description of the improvements which are nearly completed at the Roundhay Park. A more pleasant recreation-ground, we may add, and we have seen many, could not be desired.

AT Mexborough an inquiry has been held at the Market Hall in reference to an application of the Local Board for power to borrow 14,000*l.* for purposes of water supply (including the purchase of the undertaking of the Mexborough and District Water Company, Limited), and 2,250*l.* for works of street improvements and sewerage.

ON Monday a large building, four storeys in height, situated at 61 Bishop Street, Glasgow, and occupied by Mr. Richard Fraser as a cotton store, suddenly collapsed, four workmen fortunately escaping just before the structure fell. The building was of brick and was a very old one. On the third floor about twenty tons of cotton were stored, and the four workmen observing that the building was giving way, rushed from the place just before the three lower flats and about 25 feet of one of the side walls crashed to the ground.

THE Crown Hotel, Scarborough, the principal hotel in the town, has, the *Leeds Mercury* understands, been purchased by private contract by the Scarborough Company. The purchase money is stated to be 25,000*l.*

AT Manchester St. Mary's Churchyard and the site of the old church have been converted by the parks committee into a pleasure ground for the public, and the gates were opened yesterday for the first time. The ground is about half an acre in extent, and is one of the pleasantest of the now numerous open spaces in the city.

THE finance committee of the Widnes Town Council report that the Local Government Board has sanctioned the borrowing of 10,265*l.* for the provision of the proposed technical schools and free library. The committee recommend that application be made to the Local Government Board for sanction to borrow 9,130*l.* for various works of private street improvements, the night-soil depôt, and the provision of disinfectant and mortuary buildings at the infectious diseases hospital.

THE Wilmslow Local Board have been granted a provisional order enabling them to acquire nine acres of land on the border of their district for a sewage farm, to stop the pollution of the river Bollin.

THE Trawden Local Board propose to borrow 5,000*l.* for sewage purposes, and to construct works connected therewith.

THE Glasgow Bridge Bill has been passed by Lord Belmore's committee, under conditions which were assented to on behalf of the promoters.

THE British fire brigade officers, under Captain Dyson, have returned to London, having travelled over 4,000 miles and inspected some 160 Continental fire brigades, including those of the cities of Amsterdam, Berlin, Vienna, Budapest, Venice, Florence and Milan. They have got together a mass of information, rules and annual reports of various brigades, illustrations and drawings of fire apparatus, and several small appliances novel to this country.

AT the meeting of the Hartlepool Town Council Mr. Hunter called attention to the dangerous and disgraceful condition of the town owing to a total cessation of the public lighting, but the lighting committee said they merely acted upon last year's instructions from the Council to suspend the lighting for three weeks on each side of the longest day.

AT the meeting of the Royal Meteorological Society on Wednesday, the 20th inst., papers will be read on "Fogs Reported with Strong Winds during the Fifteen Years 1876-90 in the British Isles," by Mr. Robert H. Scott, M.A., F.R.S.; and on "Some Characteristic Features of Gales and Strong Winds," by Mr. Richard H. Curtis, F.R.Met.Soc.

AN inquiry has been held by the Local Government Board at Conway into an application made by the Town Council for powers to borrow 1,000*l.* to erect workmen's dwellings.

AT the Methodist New Connexion Conference in Loughton on Wednesday it was reported that forty-five new chapels and schools had been erected during the year, the estimated value of which was 29,418*l.*

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS.

Extract from THE GENTLEWOMAN (Mrs PANTON) — "You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES completely furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

ARCHITECTS' Plans and Designs exactly and faithfully worked to.

Tenders Free for ELECTRIC LIGHTING.

SANITARY Work, STRUCTURAL Alterations, and every kind of Interior & Exterior DECORATIONS.

N.B.—House and Estate Agency Offices (213 Tottenham Court Road),
SURVEYORS, AUCTIONEERS AND VALUERS.

HEWETSONS, TOTTENHAM COURT RD., LONDON, W.

440.—English Carved Oak Writing Table, Leather Top, on Casters £15 10s.

Without Drawer and Pigeon-holes on Top, £10 10s.

THE Lord Provost's committee of the Edinburgh Town Council have instructed Messrs. Cunningham, Blyth & Westland, C.E., in conjunction with Mr. Morham, city architect, to prepare plans of a new North Bridge. It is not expected that these will be ready for three months.

TRADES CONFERENCE.

THE first of a series of trade conferences to discuss the subject of technical education in its relation to the various London industries has been held at the County Hall, Spring Gardens. Mr. Sidney Webb presided. The Technical Education Board of the County Council convened the conference in order to hear suggestions from those engaged in the trades as to the best method of allocating the all too small means at the disposal of the Board for assisting technical education in these industries. Mr. Dilly, of the bricklaying trade, who was first called upon, pointed out that the practical workshop of to-day is not at all what it should be, and that the bricklayer is being left behind because he is ignorant of sanitary science, especially in regard to drainage and ventilation. It was suggested that bricklayers should have to pass a practical examination, just as carpenters, plumbers and metal-workers do, and that they should be registered. The majority of delegates who subsequently spoke advocated a return to the old apprenticeship system, and declared that the work of the classes must supplement the work of the workshop.

Mr. F. T. W. Goldsmith, hon. secretary of the Architectural Association, on being asked by the chairman, Mr. Sidney Webb, L.C.C., to speak, referred to the necessity of affiliating workshops to the Architectural Association, with the view of bringing the architect and the craftsman into closer relationship than at present.

Mr. Goldsmith stated that, as representing the Architectural Association, he ventured to commend the scheme to the earnest attention of the Technical Education Board and to ask the Board to assist the Association in this branch of its work with grants of scholarships, pointing out that benefit could not fail to result from the architect learning in the workshops, with the workmen, the limitations of the materials which he designed, and the advantage that must necessarily accrue to the workmen from being so associated with the architect, which would result in a better understanding between the architect and the craftsman. Mr. Goldsmith carefully pointed out that the carrying out of the scheme would not result in any infringement of trade

rights, but that all the instruction would be given by properly qualified workmen, who would be generously paid for such instruction. It was proposed to make the instruction less in the form of a class than by direct personal supervision by artisans skilled in the different trades. He trusted that in the course of time the scheme might be widened and extended with the help and support of the County Council, and referred to some correspondence in the current number of "A. A. Notes," which indicated the lines upon which this proposal might be carried out.

WOOD PAVING IN MELBOURNE.

ACCORDING to Mr. A. C. Mountain, the city surveyor of Melbourne, Australian timber was first used as a material for street-paving in Sydney, N.S.W., where an experimental section (comprising several kinds of New South Wales hard and soft woods) was laid in August, 1880, under the direction of Mr. Mountain, who was then city surveyor to that city. The result of this test established the fact that several of the Australian hardwoods were well suited for street pavement. This example was soon followed by the city of Melbourne, the result being that at the present time these two great centres and their suburbs contain considerably over half a million square yards of paving composed of Australian hardwoods.

At first the practice was to lay the blocks in rows with wide joints (from $\frac{3}{4}$ inch to 1 inch in width), but experience has shown that—with proper care during damp weather—the hardwood blocks on ordinary gradients gave good foothold to horses, and the width of the joints has been gradually reduced to $\frac{1}{4}$ inch, and in Sydney the joint has been actually abandoned and the blocks laid close together.

In New South Wales the woods principally employed on this work are:—Tallow wood (*Eucalyptus microcorys*), black butt (*E. pilularis*), spotted gum (*E. maculata*). The various ironbarks, admirable as they are in strength and durability, are not used, being too valuable for wood-paving.

In Victoria, the only locally-grown hardwood used on the streets, to any extent, is the Murray river red gum (*Eucalyptus rostrata*); but the West Australian kauri (*E. diversicolor*) has been introduced, and also the New Zealand kauri pine, both of which timbers have answered well in the work. The latter, although not a hard wood, would appear to have a much longer life in the street than the Baltic or Memel pines used in England and the Continent for wood-paving.

NOTICE.

Mr. JOHN GRUNDY has purchased the whole of the Valuable Stock and Patents of The Helios and Calorifer Stoves from Mr. H. HEIM, of Vienna and Oxford Street, London, W.

The Premises 95 and 97 Oxford Street will be open until June 24, and Architects and Builders are invited to call, as the stock, which is a very valuable one, will be sold at greatly reduced rates.

HEATING APPARATUS.

SUCCESS GUARANTEED. GRUNDY'S SPECIALTY. PURE WARM AIR.
UPWARDS OF 1,000 TESTIMONIALS RECEIVED FOR

GRUNDY'S PATENT APPARATUS

For Heating all kinds of Buildings with External Air, Warmed by his System.

Recommended by many of the most eminent Architects throughout the United Kingdom.

EVERY KIND OF HEATING APPLIANCE

Manufactured at Grundy's Foundry, Tyldesley, near Manchester. All kinds of

Stoves and Fire Grates, and every kind of Hot Water Heaters.

Combination of Pure Warm Air and Hot Water as applied to Truro Cathedral, Londonderry Cathedral, Cardiff New Catholic Cathedral, Kilmore Cathedral, Sherborne Abbey, Wandsworth and Clapham Workhouse, Queen School Chapel, Eton; Corpus Christi College, Oxford, &c., &c. Book of Testimonials forwarded Gratis on application to

JOHN GRUNDY,

Warm-air Consulting Engineer, 30 DUNCAN TERRACE, CITY ROAD, LONDON.

Telegrams:—"JOHN GRUNDY, LONDON." N.B.—Perfect Success Guaranteed or no Pay.

The factors governing the wear of a road are so difficult to calculate, and the method of construction so liable to afford variable results, that it is hard to say with certainty how long Australian timber will last in a street. It is fair to assume that in a street of heavy constant traffic (such as Flinders Street, Melbourne, or George Street, Sydney) a thoroughly well made wood pavement would last from twelve to fourteen years. This will mean sound well-grown timber, free from sap or decay of any kind, laid on good foundation and with thin joints. A bed of Portland cement (varying in thickness from 6 inches to 12 inches, according to the nature of the foundation, finished off with cement rendering consisting of 3 of sand and 1 of cement) not more than 1 inch thick, to insure a fair and even surface, is first laid. On this the blocks varying in breadth from 7 inches to 9 inches, 3 inches in thickness and 6 inches depth (measured along grain of wood), after being dipped in hot tar and well drained, are laid down with close joints diagonally across the street. The joints are then sealed by being "run in" up to the surface with hot tar, boiled for two hours and no longer. A few mastic joints should be left occasionally on account of swelling.

BUILDING AT LONGTON.

At the last meeting of the Longton Town Council a report was received from the plans committee which referred to the intended new streets proposed to be laid out in the Florence district by the Duke of Sutherland. The borough surveyor had applied for plans and sections of the 12-foot back roads at the rear of the properties to be built, in accordance with section 39 of the Longton Improvement Act. Mr. J. H. Garrett, the duke's surveyor, had written stating that this question of back roads was fully discussed some years ago, with the result that section 39 was not put in operation with respect to certain property at Normacot. Being under the impression that the section would remain inoperative he had continued to negotiate the disposal of his grace's land for building purposes without making any provision for the introduction of the back slums now asked for. Plans of new streets and of many new houses in the neighbourhood had been passed by the Council without mention of these back roads, and now that the district was partially laid out and no notice having been taken of section 39 for so many years, it seemed harsh to spring it upon them again without any apparent reason. The committee recom-

mended that in all cases wherever land is laid out for building, and the backs of dwellings in an intended new street shall be opposite to the backs of dwellings in a street parallel therewith, there shall be provided a back road, not less than 12 feet wide between the yards of such dwellings, such road to be uncovered for its entire length, and at or near the end thereof communicate with a street. Mr. E. Brookfield said that the whole difficulty had arisen through the Duke of Sutherland disposing of his land for building purposes without giving the purchasers an opportunity of complying with the requirements of the Corporation. The simple question was whether their Act of Parliament regulating such matters was to remain a dead letter, or whether the plans committee were to enforce it. Several members contended that the Act ought to be enforced as strictly in the case of the Duke of Sutherland as in that of an ordinary individual, and ultimately the recommendation of the plans committee was confirmed.

THE TEAK TRADE WITH SIAM.

A PAPER was read in the Modern Section of the Society of Arts recently by Mr. C. D. Leckie on the commerce of Siam. In the course of it he said:—In the northern towns of Cheangmai and Lakon one meets with British houses established in business, directing the working of the teak forests; one meets with British Burmans and Shans in numbers working the forest contracts; and when the teak has been passed down to Bangkok, you find three steam mills belonging to British firms, and one only worked by a Chinese-Siamese firm. There are four smaller establishments with some machinery—one, an Anglo-French firm; another, Austrian-French; a Dutch and an Italian; but those four firms together do but a very small export business. In these mills you again find only British machinery. As the export of teak from Siam is almost entirely confined to Europe (the cargoes being sold through London), or Bombay, or Hong Kong, one may speak of the teak trade of Siam as a British trade, carried on by British capital and British management. London merchants have put down large sums of money in the north of Siam in this teak industry, for the business entails the employment of a large capital. There are no German or French firms connected with the northern teak forest works.

Ten years ago the British trade in teak was confined to the Bangkok district, and the only means open to the Bangkok merchants of securing teak was by buying rafts of rough

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

timber from the natives as they reached Bangkok, or by buying hand-sawn squared teak from the Chinese hand-sawyers in Bangkok. Nowadays the British firms work the wood themselves out of the forests, and pass it down the rivers to their Bangkok mills.

A teak forest is generally supposed to be something entirely different from what it actually is. One can go up the bed of a stream flowing into one of the northern rivers, and you may walk miles without seeing a single teak tree; you meet with paddy-fields, dense jungle, open jungle, mountain gorges, splendid scenery, but the thing you meet with seldom enough when looking keenly for it is a teak tree. The teak grows here and there on the sides of the hills which spread for miles from the stream, and although in places it grows in rich patches, it was never my fortune to get into a really rich patch. The method of the work is tedious. A forester sends his elephants, in care of their mahouts, into the forest, for which his employers have a lease from the Government or the working rights from the holder of the lease, and drags during the rainy season as many logs as his elephants can manage to the bank of the stream. It is quite a usual thing for the teak to be dragged four or five miles to the stream, and it is a good forest which can show a record of fifty logs being worked by one elephant in one season. The elephants then stack the wood on the bank of the creek, where it awaits the inspection of the buyer. After measuring the logs are put into the stream, and then comes the great delay, often enough, of waiting for sufficient rain to float the wood down the streams into the rivers. With a moderate rise of water, the elephants follow the wood along down the river bed, and push it off sand-banks and rocks where it sticks, and get it into the river at last. When once in the river the wood is left to itself, if the water is too deep to allow the elephants to walk down the river bed, and the logs spin away down stream unassisted. After passing through the rapids, which descend to the low lands extending from the sea to the foot of the northern plateaus, the wood is caught by rafters, and tied up into rafts of 150 on the Me Ping, or 100 logs in the Eastern river, and sent on down the 400 miles or so to Bangkok in care of the Siamese rafters. The rafting waters are from June to November. The work is slow, for the average time used in delivering a teak tree into Bangkok from its stump where it was felled is about three years, although the distance actually covered is not over 600 miles.

The Burmese and Shan foresters who work for the British firms are all British subjects, and as the trade is carried on for the most part through them, the teak trade in the forests is really a British trade. The owners of the forest leases with but few exceptions are the Laos chiefs and princes, who receive a royalty on every log worked out of a forest, and the Government collect a second duty before the wood enters Bangkok. The labour is mostly supplied by the native hill tribes, Kamouks and Kariengs. Kamouks come to the teak workings from across the Mekong, and as they are now being cared for by the paternal Government of France, it is possible our labour question in the teak forests may become difficult.

The preservation of teak forests, which has had such excellent attention from the British Government in India, has been ignored in Siam; but we now begin to hear of certain stipulations being put into new leases, imposing on the lessee the obligation to plant four teak saplings for every one tree felled during the term of a lease. The British firms buy only wood which has reached a certain maturity, and their contractors deliver no very young wood. But the natives send down to Bangkok annually large quantities of quite young teak; this has gone on unchecked by the Government, and several thousands of these logs come on the Bangkok market every season, and are bought for posts and light beams and house work. The simple remedy of forbidding the delivery past the Government timber duty station of all teak below a certain girth would cure the evil quickly, and prevent any necessity of irksome stipulations being imposed on British traders.

The annual export of teak from Siam to Europe, Bombay and Hong Kong is likely to increase, as the northern forest work gets better organised, and the elephant force employed increases. The annual supply of rough logs into Bangkok is so entirely dependent on the rainfall for the year that there must always be the great variation in quantity shown by the export lists of the past six or eight years. I will mention here that the coinage used in the north of Siam is the Indian rupee. As soon as the Cheangmai plateau or the Lakon, Phrae, Nan or Ootaradit districts, and the rich Mekong plain are reached, the Siamese tical ceases to pass current, and in this large section of Siam the British rupee is the only coin the people understand. The British teak firms have to import their rupees and send them up to Cheangmai. It is interesting to find a large portion of Siam using British coin, and maintaining it for many years after the establishment of the tical mint in Bangkok.

TRADE MARKS IN GREECE.

IN his last report Captain James Boyle writes from the British Consulate at the Piræus:—The bill for the protection of industrial and trade marks in Greece has now come into operation. Her Britannic Majesty's Minister at Athens enclosed a translation of the bill to the Foreign Office, dated January 16, 1893, but since this a royal decree has sanctioned the bill, and it has become law. There is no doubt but that this bill was very much needed, as there were frequent frauds of trade marks and infringement of existing regulations; but now this bill is passed and has become law, parties registering their trade marks will have full protection as long as they abide by the rules laid down. It is necessary for anyone wishing to register their trade mark in Greece, in the first instance, to proceed as follows:—1. They must send out to Greece three copies of their trade marks with plate to their representative. 2. A copy of registered trade mark in England, which must be legalised by the Greek Consul wherever there is one. 3. A special power of attorney, and to save trouble and expense, this power to be made out in the Greek language and preferably at a Greek Consulate. All the above documents will be placed in the Court of the First Instance at Athens. Sixty francs in gold, not paper, and two francs in gold is to be deposited in the Treasury at Athens on application for registration. Ten to twelve francs in gold will cover all other expenses so I am told, such as stamps on legal paper, &c., fees to clerks, but whether this can be said to be correct I am unable to say, as every official clerk in the Greek courts appears to claim something. It will be necessary for anyone wishing to register his or their trade mark to appoint someone as their legal representative in Piræus or Athens, to carry out the various regulations, and on application to me I shall be most happy to give the name of some trustworthy person who can perform all the necessary duties.

NEW COMPANY.

THE business of Messrs. Baird, Thompson & Co., ventilating, sanitary and heating engineers and specialists, London and Glasgow, is being converted into a limited liability company with a capital of 60,000*l.*, and the prospectus is now being issued privately amongst their friends and clients. The prospectus is accompanied by a list of some of the more important works carried out by the firm at home and abroad, filling 16 quarto columns of printed matter, and includes the palaces

of the Emperors of Germany and Austria, the Admiralty, War Office and other Government offices, many theatres, town halls, colleges, institutes, schools, churches, ships, &c., in all parts of the United Kingdom and various parts of Europe. This list, however, it is stated, conveys only a partial idea of the extensive business that has been carried on by the firm, as it professedly only deals with ventilation, heating and sanitation of buildings, &c., and gives little or no account of the important work which has been and is being done by them in ship, tunnel and mine ventilation, also drying and cooling, in water softening and filtration on a large scale for public supply, and in other departments of scientific sanitary engineering. The board of management is constituted as follows:—

Directors:

ALAN B. CROMBIE, Esq., architect, Dumfries, N.B.
WALTER ROWLEY, Esq., F.S.A., M.Inst.C.E., 20 Park Row, Leeds, and 12 Finsbury Circus, London, E.C. (mining engineer to the G. N. and N.E. Railways; governor of the Yorkshire College, Leeds).
JAMES MATHER, Esq., 15 King William Street, London, E.C.
J. D. GRAY THOMPSON, Esq., C.E., M.S.A., will join the Board after allotment as managing director.

Special Foreign Representative Director:

General Sir STEPHEN LAKEMAN, Bucharest.

Consultative Sanitary Adviser:

Sir BENJAMIN WARD RICHARDSON, M.D., LL.D., F.R.S., London.

Consulting Engineers:

DAVID COWAN, Esq., M.Inst.C.E., Kersehill, Falkirk, N.B. (For mines, tunnels, &c.)
EDWARD TIDMAN, Esq., C.E., F.S.I., M.S.A., 34 Victoria Street, Westminster, S.W. (For sanitation, sewerage, &c.)
D. MEIKLERIED, Esq., N.A., M.I.E., 9 Gracechurch Street, London, E.C. (For naval and marine.)
A. BASIL WILSON, Esq., C.E., M.I.M.E., Holywood, Belfast. (For general contracts.)

Under such auspices the company hope to maintain the position already achieved by the firm in the promotion and advancement of sanitary science. The shares are not being advertised, but information thereon and copies of the prospectus can be obtained from the Secretary of the company at their head offices, 159 Queen Victoria Street, E.C. Only a limited number of 5*l.* guaranteed 8 per cent. minimum preference shares are being offered.

THE ARBITRATION CLAUSE IN SCOTLAND.

THE law in Scotland does not correspond in all respects with English law, but there seems to be no difference between the practice of the two countries when dealing with the arbitration clause in contracts. The correspondence has been manifested in an action in which Mr. John Mackay, contractor, Inverness, sued the Thurso River Harbour Trustees for 7,519*l.* 7*s.* 2*d.* In 1890, Mr. Mackay undertook the construction of works at 14,577*l.* 16*s.* 9*d.* It was provided that as security he should deposit 1,000*l.* in the names of himself and the clerk to the trustees. Operations began in November 1890. Mr. Mackay withdrew in March 1893, in consequence, as he alleged, of the failure to pay the instalments. The trustees then took possession of the works and proceeded with the construction of the harbour. As this act was said to be illegal, plaintiff thought that they should be ordered to deliver the machinery, &c., up to him, or pay the value, 1,359*l.* 13*s.* The Trustees pleaded that under the reference clause in the contract the questions at issue ought to be remitted to Mr. James Barron, C.E., Wick, the arbiter named. The plaintiff maintained that Mr. Barron having identified himself with the interests of the harbour trustees, and having throughout exercised his functions as engineer and arbitrator according to their advice and instructions instead of according to his own judgment, was disqualified from acting as arbiter.

Lord Wellwood, who heard the case, said that in order to void such an agreement to submit as that contained in the contract, it must be shown either that the question did not fall within the reference clause or that the arbitrator was disqualified, and in his opinion the allegations on both of these points were insufficient and inconclusive. The contractor's position was that he was compelled to dissolve the contract in consequence of his not being kept in funds to carry it out. The matter to be inquired into was whether the contractor was or was not paid a fair value for the work as it proceeded, and whether he was or was not entitled to dissolve the contract by throwing it up and compelling the trustees to finish the work at their own hand. These questions fell precisely within the matters which the parties agreed to submit to an arbitrator. Another question was whether any relevant statement had been made to the effect that Mr. Barron was disqualified from acting as arbitrator. In such a matter the contractor was bound to make most specific statements of corruption. He had not done so, and they were left entirely in the dark, as to the precise ground of

disqualification. The complaints were wrapped up in a cloud of words which might mean anything, but were not relevant to infer that the arbitrator was disqualified. As regards the claim of damages, if the defendants were in fault in withholding payment for the work done, then the plaintiff had no claim of damages at all. Even supposing that the arbitrator should hold that the plaintiff was in the right, his lordship still thought there was no relevant claim of damages, because, in his view, the contractor should have got the decision of the arbitrator during the contract, and if he had done so this claim of damages never would have emerged. His lordship accordingly found that the questions raised other than the claim of damages should be submitted to the arbitrator. As regards the claim for damages, he found that the plaintiff's statements in support of it were irrelevant, and dismissed the action in respect of that claim. The question of expenses was reserved.

NEW INFIRMARY, KING'S NORTON.

THE King's Norton Board of Guardians recently invited architects to submit designs for a new infirmary, on a site adjoining the present workhouse at Selly Oak. Nineteen sets of plans were sent in. Those by Mr. Daniel Arkell, of Birmingham, obtained first place, under the motto "Practical." Second position was awarded to "Comforts for the Poor," by Messrs. Essex, Nicol & Goodman; "Hygiene," by Mr. Lavander, being placed third. Mr. Arkell's designs will be carried out, and comprise an administrative block in the centre, containing matron's and medical officers' rooms and stores, and a scheme is shown for suggested future extensions for operating-rooms, with lavatory, surgeon's private and consulting rooms, medical stores, dispensary, dispenser's private room and store. At the rear of the administrative block are the cooking kitchens, nurses and servants' rooms, cooks' room, culinary stores, sculleries, washhouses and laundries. Provision is made at the extreme rear of the buildings for a future nurses' home. From each side of the central administrative block run straight corridors, to which the sick-wards of the new infirmary are connected, these having nurses' duty rooms, separate rooms for two and four beds, and linen closets in close proximity, with bath-rooms, water-closets and lavatories at the end. These are connected to the wards by short lobbies to give cross ventilation. Emergency staircases are provided to each ward, and hydrants are placed in all wards and along the corridors, so that sufficient means

will be at hand to deal with any outbreak of fire. The wards are spaced out along the corridors in such a manner that the air has free circulation round them, and they are also so situated that the full benefit of the morning and evening sun is obtained. Accommodation is provided for 250 patients, viz. 120 males and 120 females, with lying-in and labour wards for 10 persons. The wards are heated by means of open stoves. The administrative block, kitchens, &c., are made large enough to deal with an additional 250 patients, which with the 250 provided for in the present scheme would make a total of 500 inmates. The whole of the buildings are so placed that they may be extended at any future time. The new infirmary will be carried out as nearly fireproof as possible, and the sanitary and ventilating arrangements will have great care and attention, so as to make the new building in every way perfect. The front elevation to the road will be of a plain character, but will have an imposing appearance; the open verandahs which are shown at the ends of pavilions will have a very picturesque effect. The whole of the drawings have been well planned and show careful study. The infirmary when completed, including furnishing, will, it is estimated, cost nearly 20,000*l.*, and the works are to be commenced forthwith.

THE KIRKDALE PRISON SITE.

A DEPUTATION from the Liverpool Corporation waited upon the Home Secretary on Tuesday asking that the Kirkdale Gaol, which is now disused, should be sold to the Corporation for the purpose of utilising the site as a recreation-ground. Mr. Miles, chairman of the finance committee, Mr. Garnett, chairman of the estates committee, and Mr. Skelmerdine, the city architect, represented that the prison was situated in the midst of a thickly-populated neighbourhood, and the nearest public park was a mile and a quarter distant. The Corporation had been much pressed to find work for the unemployed, and this would enable them to do so in pulling down the buildings and laying out the grounds. They felt that they ought not to be placed in competition with the speculative builders who desired to make a profit out of the site, and urged that the Government should follow the precedent set in regard to the Millbank Prison site. The Corporation had a surplus of the city fund, and were prepared to give 15,000*l.* for the site of 10½ acres. Mr. Asquith, in reply, expressed his sympathy with the objects of the deputa-

tion, and said that he should certainly give the Corporation the preference over the speculative builder, but the fact was that in this case the tenders so much exceeded the price which the Corporation had previously expressed their readiness to pay, which was less than the 15,000*l.* now offered, that in the opinion of the Treasury (from which he could not dissent), as representing the taxpayers, they would be hardly justified in making so large a sacrifice. The highest tender was 17,650*l.*, and if the Corporation's present offer were accepted that would represent a sacrifice of 2,650*l.* He would use what gentle pressure he could upon the Treasury to secure the site for the Corporation, so that it should not be built over; but, on the other hand, it was possible the Corporation would also have gentle pressure put upon them to make a further advance in their offer.

PRESERVING TIMBER.

WHEN Mr. Gardner, Jamaica Street, Glasgow, introduced his process nearly twenty years ago, we gave several notices, the *Glasgow Herald* says, as to the successful tests made in coal pits and dry-rot localities, where two or three years gave severe tests, and now we have the pleasure to know of a fifteen years' test, which deals with an extensive range of quays, where rot would show itself in about three years if the timber had not been preserved. It gives also the property of being partially non-inflammable and so different from creosote that the preserved timber is not only used for docks, railway sleepers, &c., but having no smell, covers the whole range where timber is required up to the finest of cabinet-work, and as the cost is less than that of creosoting, we have no doubt but a great future is in store for a process having so wide a scope. Extract from letter from engineer to Greenock Harbour Trust, showing results of fifteen years' exposure of Gardnerised timber:—"Greenock Harbour Trust Engineer's Office, Greenock, May 22, 1894.—In 1879 the pine timber used in the extension of the West Quay here was subjected to Gardner's No. 2 process. In 1881 the pine timber used at the new frontage to the Custom House Quay was also subjected to the same process. In both cases the timber has stood remarkably well. Within the last month, Mr. R. Crawford says, I made a special examination of the above quays and found the timber quite sound. If I had additional wharfage to provide, I would have all the timbers Gardnerised."

POWER DISTRIBUTION BY ELECTRICITY, WATER AND GAS.

(Concluded from last week.)

Now let us briefly consider how power produced by gas-engines can meet the needs for electric light for a large town provided with a complete network of gas mains. In this case (which is practically the case of every large town in the civilised world) the electric light comes as competitor against the method of illumination which has practically only just established a firm reputation for reliability, economy, efficiency, &c. There is no doubt that the conveniences of gas for lighting and heating are apt to be overlooked because of our familiarity with them. Had we experienced the inconveniences of oil and candle lighting I feel sure the electric light would not have made so much progress as it has done. Further, the gas business is in the hands of a powerful body, powerful alike in experience and in resource.

Experience of practical working in London and other large towns shows that in certain districts and under certain conditions there is a sufficient demand for the electric light to make it worth while to work independently of the gas company altogether. But consider the very vast majority of country towns already supplied with gas, where it is obvious that an independent electric light company would eke out a very miserable existence, and that probably for only a short time; it would certainly seem reasonable that a combination of electric light and gas interests would solve the problem of electric supply to the inhabitants, and if this is so, then the principle ought to apply *à fortiori* to large towns. At present these interests conflict, and it is universally experienced that some one has to pay for this conflict.

Let us try and examine this a little more closely. If electric light and gas interests harmonise, the first advantage that suggests itself is the ready-made central station, namely, the gasworks. It is then necessary to establish distributing stations at suitable points in the town. Each distributing station would consist of gas-engines and dynamos and regulating apparatus. Each distributing station would supply its own network of mains for the needs of its own neighbourhood. These networks would have to be connected by a trunk main, so that any one

station could be relieved by any other in case of emergency and during the period of light load. The details of the plant of each station and the number of stations would be dictated by local conditions, so that it is impossible to do more than state the broad principles.

As there would be no boilers, no chimney-stack would be required. Probably in nine cases out of ten the basement of some house could be adapted to accommodate the necessary plant—hence a great saving would be effected in special buildings. Further, the labour required would be diminished. The cost of superintendence would probably remain the same, but might be increased.

Now as to the cost per unit delivered, there is fortunately not much difficulty in determining this, as many examples of the generation of electrical energy by gas power now exist. The author has selected the results of the weekly records of a plant at Bradford supplying 300 lamps. The total cost per kilowatt hour delivered is almost exactly 2d., with town gas at 3s. 3d. per 1,000. But to adapt this to a distributing station, 5 per cent. should be added for loss in mains, and 0.3d. per kilowatt hour for depreciation in plant and buildings. This would bring the cost to 2.4d. Adding the very liberal allowance of 0.6d. per kilowatt hour for management expenses, the total cost would amount to 3d. per kilowatt hour delivered. This is a lower figure than that usually realised in practice by any purely electric supply company working under the conditions above assumed, and no doubt this aspect of public electric supply has for some reason or other not received the attention it deserves.

In order that the two systems (direct use of gas and gaso-electric) be commercially equivalent, the cost of maintenance of the plant, the interest and depreciation and management expenses must be compensated for by the economy in gas consumed.

Now it is frequently thought that nothing can be more economical than the system of sending the gas direct to the burner. But this is far from being true. The miserably low efficiency of the gas-burners is rarely appreciated. According to Professor Tyndall, the efficiency of the gas-burner is 0.317 per cent. Taking the calorific value of London gas at 620 thermal units per cubic foot, only the equivalent of 10 thermal units reappear as light out of a possible 3,100 thermal units in a 5-foot burner. When gas is utilised to produce motive power, its efficiency and that of the incandescent lamp is so superior that a very different result is obtained. The efficiency of a

ESTABLISHED 1860.

16 per cent. incandescent lamp being about 6 per cent., and assuming a mechanical efficiency of 80 per cent. for the gas-engines and 85 per cent. for the dynamos, including loss in transmission, it is found that about 25 thermal units would reappear as light out of a possible 3,100. So that in spite of the threefold transformation of energy introduced, the final result is increased 2.5 times. This ratio would of course be still further increased in the case of arc lamps. The value of these ratios, taking minimum values in the cases of electric generation by gas-engine power, are as follows:—

Character of Burner.		Percentage increase of candle-power obtainable by using a gas-engine to drive a dynamo supplying electric lamps, as compared with that obtained by burning the gas direct.
Gas.	Electricity.	
A good ordinary 5 feet gas-burner, such as a Bengel burner.	An incandescent electric lamp, using 4 watts per candle, and giving 16 %	Per cent. 78
A Wenham lamp.	An arc electric lamp of same power as Wenham gas lamp.	227

The reason of this is that the chemical combustion of coal gas with oxygen yields a flame in which the undulatory vibrations of a sufficient frequency to become luminous are extremely few compared with the heat waves, whereas in a gas-engine it is these heat waves that are transformed into mechanical energy.

The chief points of a gaso-electric system of distribution may be summed up as follows:—

(1) The generating station already exists and may be considered as an eccentric power house. (2) The existing gas mains are available, hence there is no question of a separate main network being laid as in the case of hydro—or aro—

electric supply. (3) The useful efficiency of gas is out of all proportion greater when utilised as a motive power than when burnt direct in burners, and this in spite of the extra transformations of energy introduced. (4) It is more than probable that under a system such as has been discussed above, the cost of maintenance, superintendence and management expenses will be less than under conditions of independent electric supply. (5) By paving the way for the substitution of electric for gas lighting without conflict of existing interests, an incalculable benefit is conferred on the community.

Of course the hydro-electric system may be treated from the same point of view if once hydraulic supply mains exist. But the present efficiency and character of high-pressure water motors do not suggest the possibility of any very great economy being effected. It must not be forgotten that Van Rysselbergh's claim to economy is based upon a motor efficiency of 80 per cent., which, though not unattainable, is very high and could not be relied on as an average result in practice. But for large private installations the energy supplied by the hydraulic power company could with advantage be utilised.

Take, for example, an installation in which, say, 200 8 candle-power lamps each burn on the average 3 hours per day. The average electrical energy required would be 18 kilowatt hours. In order to profit by the rates of the hydraulic power company it would be necessary to employ accumulators and to charge during the night or early morning. For such an installation an accumulator costing complete 350*l.* would amply suffice; the motor and dynamo and instruments might cost, say, 150*l.* more, making 500*l.* in all.

The maintenance account would then stand as follows:—

Interest and depreciation at 10 per cent.	£50
Cost of hydraulic power per year of 300 days, taking 66 per cent. as combined efficiency of motor and dynamo. Water at 1 <i>s.</i> per 1,000 gallons and 10 per cent. loss in cells.	740
Attendance and maintenance, say	50
	£840

Cost of energy drawn from supply company's mains at 6 <i>d.</i> per unit, 18 kilowatt hours per day at 6 <i>d.</i> for a year of 300 days	£1,350
---	--------

This shows that even on so moderate sized an installation a very great saving can be effected by generating electricity on the premises and using hydraulic power.

THE SANITARY INSTITUTE.

THE following papers were set in the examination for local surveyors on June 1 and 2 :—

1. What is the distinction between "sewer" and "drain" under the Public Health Acts Amendment Act? and give a summary of the powers and duties of local authorities in the laying down of sewers, in the ventilation of sewers, and in the inspection of house drainage.

2. What are the existing requirements of the model by-laws as to (a) height, (b) thickness of walls, (c) prevention of fire, (d) facilities for the disposal of house refuse in the case of new buildings?

3. Describe a pan closet, a hopper closet and a valve closet; also a D trap, a P tray and an S trap; which is to be preferred respectively? Give your reasons for and against each.

4. Describe two chemical processes for purifying sewage and also its purification by land.

5. If you are called upon to report whether or not the drainage of a house with the sewer has been properly made, in a town which has adopted the model by-laws of the Local Government Board, to what points would you more particularly direct your attention? Illustrate your answer by sketches.

6. If you have to convey the sewage of a district on to land two miles off, and at a level which cannot quite be commanded by gravity, would you prefer to pump it through an iron rising main or to make it flow along a sewer and lift it vertically at the outfall end? What are the considerations that would influence your decision? State the most important advantages and disadvantages of each alternative.

7. Show by sketches the methods of jointing a 4-inch lead soil-pipe, its attachment to a wall and its junction with a 6-inch stoneware house-drain. Give all the dimensions.

8. Point out the advantages and disadvantages of the various sources and modes of water-supply.

9. How is water filtered on a large scale for town supply? Illustrate your answer by sketches, and also state under what circumstances such filtration is likely to purify water.

10. What are the sanitary advantages and disadvantages of the modern systems of street and road-making? Give a brief description of each with sketches?

The following fifteen candidates were certified, as regards their sanitary knowledge, competent to discharge the duties of local surveyor :—Leonard William Barnard, 38 Bark Place, W.; Albert John Davies, 154 Severn Road, Cardiff; Llewellyn

Davies, Priory House, Albany Road, Cardiff; Henry Ermrich, 106 Sebert Road, Forest Gate, E.; Thomas George Fisher, 33 Mount Street, Grosvenor Square, W.; Wm. Henry Joseph Gathercole, Public Health Department, Guildhall, E.C.; Edward Hebdon, 11 Llanion Terrace, Pembroke Dock; Thomas Briggs Hunter, Grove Road, Windsor; Charles John Kilgallin, Court House, Marylebone, W.; Ernest Ward Lashmore, 57 Denzil Avenue, Southampton; John Henry Leverton, 45 Lisburne Road, Hampstead, N.W.; James Joseph Lyon, 6 Rice Lane, Walton-on-the-Hill, Liverpool; Edward Albert Schneider, 5 Invicta Road, Westcombe Park, Blackheath; James Taylor, 17 Oxford Street, Hereford; Frederick Charles Uren, 19 Cornwall Terrace, Penzance.

A VIENNESE HAILSTORM.

A CORRESPONDENT of the *Daily News*, writing from Vienna on the night of the 8th inst., says the Viennese refuse to believe that anyone living has ever witnessed such a hailstorm as that of yesterday. It caused so many accidents and such vast devastation that when it was over the city looked as if a hundred explosions had taken place at the same time. All the windows in the city facing the wind may be said to have been smashed—a million panes of glass perhaps. The layers of paint with which the bricks are covered have fallen off in large pieces, giving the houses a dilapidated appearance. Gardens, parks, public walks and avenues are destroyed, the ground under the trees being covered with a thick carpet of leaves, which during the whole forenoon was pale under the hailstones that lay many inches deep upon them. Flower-beds look as if thousands of ruffians' boots had trampled upon them, and the gravel walks have been completely washed away. The pavements all over the town glittered with millions of glass fragments. In the public gardens dead pigeons, blackbirds, thrushes and sparrows covered the ground. The hailstones came so thick that in a moment the openings into the subterranean canals were stopped up, and the water rushed wildly into cellars and underground habitations. The planks which frame the shores of the river Wien were quickly broken down and pulled up to let the water escape into the bed of the river. This was swollen to an extraordinary height and breadth, and brought with it uprooted trees, bushes, fences and doors. The hailstones, when swept up and shovelled together lay in heaps

from 3 to 5 feet high in all the streets of the central town and along the whole expanse of the Ring.

Previous to the storm there had been a great deal of lightning. Then the clouds took a strange yellow colouring, and, coming from two sides, met just over Vienna. Then it grew dark and began to rain. Suddenly the rain changed to hail. Large stones came pattering upon the windows, but before we had time to notice them much or wonder at their size they increased in number and grew to the size of large cherries. They smashed the glass as they fell, flying across the space between the outer and inner windows, breaking the latter and falling heavily into the room. Glass and porcelain that stood on tables in the middle of the rooms were broken by hailstones that had already passed through two windows. In most houses the servants dared not let down the blinds, because showers of glass and ice threatened the face and hands. Through the broken windows hail and rain rushed into the rooms, flooding them and making the occupants doubtful, when all was over, where to begin the work of clearing. In every room heaps of hailstones were swept together. The moderately-sized house I live in had a hundred and twenty-two panes broken, the Theresianum Academy a few less than a thousand, and some steam mills four thousand. On the Ring there are some houses where not a pane was left whole.

At the most critical moment while darkness prevailed the electric light went out. The machines had been stopped because large quantities of water had poured into the engine-rooms. At the Imperial Burg about six hundred large windows were smashed. At the Town Hall many of the beautiful Queen Anne windows are heaps of broken glass, and at the Votive Church one of the huge windows of painted-glass is smashed. In many schools the children were sent home, as the teachers could not keep them in windowless rooms. There is no saying when the glaziers of Vienna will get through their work or whether the material they have at their disposal will suffice. No doubt some people will have to wait a long time before they get their panes mended. Already the village trick of sticking paper across the broken windows is being resorted to in the most fashionable parts of the town. As soon as the extent of the damage had been perceived, the question arose on all sides who was to pay, and many went to the police stations to ask, but received doubtful or unsatisfactory answers. The newspapers have cleared up all doubts by quoting the law which makes the landlord responsible for damage of this kind.

It is estimated that two hundred persons were hurt in all.

The majority had legs broken. It is believed that the glass smashed will take a fortnight or three weeks to mend. There are glazing firms who have orders on their books for 12,000 panes and more. At the Great Central Hospital 10,000 panes are broken. The windows have been closed with blankets at night, but as a very low temperature has set in this state of things is not without its dangers and is very uncomfortable.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37, Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

10210. Shirley Howard Brierley, for "An improved water-waste preventing syphon cistern."

10224. Karl Schauer, for "Sanitary paper covering for closet seats."

10232. James Robson, for "Improvements in ears or lugs of rain-water and vent pegs."

10243. Richard Douglas Bailey, for "Improvements in and appertaining to harness and horseshoes."

10254. George James Cole, for "Self-acting catch for doors, gates and the like."

10275. John Henry Vidal, for "Improvements in the flushing of water-closets."

10309. Eliza Rippingille and William Brandon, for "Improvements in or connected with hot-air or hot-water heating apparatus in connection with stoves and kitcheners."

10352. Edward Blum, for "Improvements in cocks for bath and other purposes."

10593. Eugen George Charles de Beaulieu, for "Improvements in wall-papers."

10609. John Johnston Green, for "Improvements in the methods of glazing bricks, blocks, tiles and the like."

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 19, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obliterated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

No. 208. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

MILTON.—June 26.—For Building Wing, &c., at Infectious Diseases Hospital. Mr. Alexander Hellard, Town Clerk, Town Hall, Portsmouth.

MURTHLY.—June 28.—For Additions to Perth District Asylum. Mr. David Smart, Architect, Perth.

VARIETIES.

THE pier at Uig, in the west of Skye, has now been completed. It has been carried out a distance of 1,040 feet, and permits of steamers calling at all states of the tide.

THE Sevenoaks Board of Guardians have been advised by the Local Government Board inspector to provide additional exits to the infirmary. He states that he generally recommends the fixing of inclined planes to the windows, with a broad wooden platform at the top, so that patients could be easily removed from the windows and put into the "shoots," and thus safely conveyed to the ground. This means of exit commended itself to him by reason of its small cost and the ease with which it could be utilised.

London Office: 16 VICTORIA ST., WESTMINSTER.

WALL INLET VENTILATOR

WITH INDICATORS

(DARRAH'S PATENT).

Incorrect Indication Impossible. Only One Action.

In the above we have introduced a most important improvement. It consists of an Enamelled Indicator, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

BAXENDALE & CO.,

Miller Street, Manchester, and Hanover Street, Edinburgh.

It has been decided to apply for a Faculty to carry out improvements at St. Mary's Church, Warwick. The proposed works include the taking down of all the galleries, the reseating of the church, and the alterations of the north and south aisles, at a cost of 3,500*l*.

LATELY the Auckland Local Board offered 80*l*. in premiums for the best scheme for the disposal of the town's sewage. Nine competitors entered, and the award has just been given. The first premium of 50*l*. has been awarded to Mr. Beesley, of London, whose estimate is 6,785*l*.; the second, 20*l*., to Mr. Balfour, Newcastle, whose estimate is 8,400*l*.; and the third, 10*l*., to Mr. Perkins, Bishop Auckland, whose estimate is 9,575*l*.

At the meeting of the Dawlish Local Board a resolution was adopted that a committee should be appointed for the purpose of ascertaining whether it was practicable to make a harbour at a moderate expense, and that they should be empowered to take the advice of a competent engineer.

THE fourth excursion of the Edinburgh Association of Science and Art, including members and friends to the number of 160, was made to the paper mills of Messrs. Alex. Cowan & Sons, Limited, at Valleyfield.

At the meeting of the Bolton School Board a resolution is to be submitted to the effect that no architect be entrusted with the work of carrying out the new Higher Grade School who cannot satisfy the Board by actual tenders from responsible builders that the same can be erected in accordance with the plans for a sum not exceeding 20,000*l*., and that the architect who fails in this condition shall not be entitled to any payment beyond that awarded by the assessor.

THE Edinburgh Water Trust have instructed their engineers to inquire into the best practical method of dealing with St. Mary's Loch as a source of supply for the city, with a view to the Works Committee bringing up a report on the respective merits of the loch and the Talla.

A SPECIAL committee of the St. Pancras Poor Law Guardians have recommended the board to take the necessary steps, subject to the sanction of the Local Government Board, to purchase property and land at Margate for the establishment of a convalescent seaside school for children, chargeable to the poor rate. The price of the property is stated to be 6,500*l*.

THE Paisley School Board, it is stated, have fixed on part of Crossflat estate, Glasgow Road, as the site for the new grammar school. The site, it is understood, will cost over 5,000*l*.

THE Hull Town Council, having applied to the Local Government Board for sanction to borrow 63,728*l*. for works of sewage, street improvements, and the formation of new streets, an inquiry, directed by the Board, has just been held in the Town Hall.

A SMALL handbook on "The Manufacture of Glazed Bricks and Glazed Sanitary Ware," published by Mr. H. G. Montgomery, is primarily intended for the use of manufacturers. When it is said that thousands of pounds have been spent in producing the recipes, the value of the information will be evident. The pages will, however, be also found suggestive by architects and builders who have to employ bricks and glazed ware.

THE *Glasgow Herald* says:—At the annual meeting of the Société Nationale des Beaux-Arts, held at the Palais du Champ de Mars, Paris, Mr. James Guthrie, R.S.A., Glasgow, was elected a sociétaire (full member). Mr. Guthrie was elected an associate in 1892.

A NEW "holiday handy book" has been prepared by Mr. Percy Lindley, with the title "Under the British Flag." It explains the facilities for cheap and convenient excursions to Holland, North and South Germany, and Scandinavia, which have been organised by the Great Eastern Company *via* Hook of Holland. Some of the most interesting places are described and illustrated in the bright little guide, which, like the others in the series, should be studied by all our readers who have not yet arranged for their annual holiday.

In the course of a letter to the *Standard* a gas consumer writes:—In reading an account of the meeting of the gas engineers at Westminster, some explanation is now afforded why nearly 90 per cent. of gas consumers are complaining of the large increase of their gas bills. It arises, no doubt, from the increase of pressure in the gas mains, for the purpose of enabling people to use gas-engines.

At the meeting of the Glasgow Police Commissioners, in connection with the sewage disposal works, it was agreed that, having regard to the treatment of sewage from other parts of the city, the services of Mr. Alsing, engineer of the works, should be retained at a fee of 250*l*. per annum on condition that he agree to be available to the Commissioners at all times for carrying out these schemes.

THE sea wall, which has been erected by the Local Board at Filey to prevent the inroads of the sea, at a cost of 15,000*l*., has been formally opened by Lord Herries, the lord-lieutenant

MAW & CO. will forward their Pattern Books, with Special Designs and Estimates for every kind of Floor and Wall Tiling, on application. Patterns can also be seen, and particulars obtained, at the Show-rooms of their appointed Agents, Messrs. W. B. SIMPSON & SON, 99 St. Martin's Lane, W.C.

of the East Riding. Mr. Fairbank was the engineer, and Messrs. Dickson were the contractors.

A MOVEMENT is on foot for throwing open to the public Bessborough Gardens, situated by the Middlesex side of Vauxhall Bridge and close to the site of the New National Gallery of British Art, which is shortly to be erected.

BUILDING AND BUILDERS.

By the renewed mediation of Messrs. W. Sugden & Son, architects, the strike in the building trade at Leek has been brought to a conclusion by the signing of an agreement between the representatives of the Masters' Association and the Labourers' Association, which makes 4½d. an hour the standard rate of wages and postpones the question of further advance for the present year, a Conciliation Board to be formed of four members of each side, with power to select an umpire, within one month.

It is stated that considerable dissatisfaction has for some time been expressed amongst those engaged in the building trades of the Todmorden district in opposition to the by-laws enforced by the Local Board. It is urged that the by-laws are so framed that building operations are at a comparative standstill, and the effect has been that the joinery, masonry and other businesses are thereby very dull, many of the hands in those trades having to play a good deal for want of work.

PLANS have been passed at the Coatbridge Dean of Guild Court for the erection of a Roman Catholic Church on the site of the present building at the corner of Main Street and St. John Street. The plans are by Messrs. Pugin & Pugin, London. The cost is estimated at between 7,000*l.* and 8,000*l.*

At the meeting of the Edinburgh Dean of Guild Court five warrants were granted, and among these the city received warrant to erect a fire-engine house at Angle Park Terrace, which will take the place of the wooden box which does duty there at present. It will be a two storey building built of stone, and will be situated a little more to the east than the present erection.

THE Glasgow Dean of Guild Court recently granted the Town Council, as improvement trustees, a lining to erect a "Family Home" in St. Andrew Street. Objections were

lodged at the time by Mr. John Dove, a neighbouring proprietor, and he has now taken the matter to the Court of Session for settlement. The plans show a building extending beyond Mr. Dove's premises.

It is announced by the *Tablet* that an appeal will shortly be made for funds to construct the Westminster Cathedral, which it has been decided "is to be in the ancient Basilica style." Owing to "the admitted impossibility of rivalling the glories of the neighbouring Abbey," Constantine's church of St. Peter has been chosen as a model, for "in no other style could the shell of a church of cathedral dimensions be erected for so little cost."

PLANS for new offices for the accommodation of the staff of the sanitary department have been approved by the Glasgow Police Commission, at an approximate cost of 17,000*l.*, the old offices in Montrose Street having been long found totally inadequate.

At the Ardrossan Burgh Court a builder, Mr. Angus Kennedy, has been fined 2*l.* He was charged with having permitted one of a number of houses erected by him in rear of South Crescent, Ardrossan, to be occupied before having obtained a certificate as to their fitness for occupancy from the burgh surveyor. The surveyor whom he had called to examine them withheld the certificate as the buildings were not completed. For defence it was stated that Kennedy was not the owner but simply the builder of the property, a sale having been effected; but the Court held that they had not to consider whether Kennedy was proprietor and builder or builder only.

THE new wing of the convalescent hospital at Cookridge, erected by public subscription in memory of Canon Jackson (Ripon) of St. James's Church, Leeds, from the designs of Mr. W. A. Hobson, of Leeds, has just been opened.

WE have received a specimen of the estimating slips devised by Mr. E. J. Sadgrove, surveyor, Surrey Street, Strand. The following are a few of the advantages claimed:—An enormous saving of time in preparing estimates from specifications. Place one slip on the left-hand margin of the specification and price the items in the usual manner. The left-hand column of the slip may be used for any abbreviated quantities or notes. The pages can then be totalled and carried to the summary, thus saving the usual procedure of booking, which generally means practically re-writing the specification. If the contractor is unsuccessful in estimating and has to return the specification to the architect, he will detach the slips, pin them

in the summary, endorse and put away, saving the usual unnecessary pile of papers. The slips should be paged to correspond with the page of specification, and if future reference be required and the specification produced, it can be seen at a glance to which item any individual price refers.

THE Keighley Guardians have been informed that the Local Government Board recommend the expenditure of 16,000*l.* on a new workhouse rather than an outlay of 9,000*l.* on altering and enlarging the present premises.

TRADE NOTES.

THE whole of the old hot-water piping in the conservatories at Chatsworth have been taken out to be replaced with "Richardson's" patent universal indiarubber expansion joint pipes, of which the Meadow Foundry Company, Limited, Mansfield, Notts, are the sole makers, and the work of renewal has already commenced.

WE hear that Messrs. Hayward Tyler & Co., of Whitecross Street, London, have been instructed to supply the whole sanitary and bath arrangements of a large naval hospital for a foreign Power in the Pacific. The closets adopted are their well-known "Tylerox" pattern, except in one ward, where the "Turkish" pattern is used. The baths are all on wheels for conveyance into the wards if needful.

THE Acorn Board Schools, York, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE have much pleasure in announcing that owing to increase of business Messrs. Clark, Bunnett & Co., Limited, have been compelled to move their offices from Rathbone Place, W., and King Street, Cheapside, to larger and more commodious offices at Queen Street, Cheapside, London, E.C., where all communications should be addressed.

AT the meeting of the gas and electric lighting committee of the Bolton Corporation, the electric engineer reported that the mains had been laid in a considerable portion of the supply area and that applications had been made for current to the extent of 1,200 eight c p. lamps.

ELECTRICAL.

THE Edinburgh authorities have made arrangements for laying the foundation-stone of the electric-light station on Monday, 25th inst. There will be a dinner in the council chambers afterwards, and later a popular lecture in the Albert Hall at 8 o'clock by Professor Kennedy, the consulting electrical engineer.

IT is proposed by the Yarmouth Town Council to introduce the electric light in Gorleston and Southtown as well as in Yarmouth.

THE electric-lighting committee of the Coventry Town Council have accepted the tender of Mr. Chas. Gray Hill for the erection in Sandy Lane of an electric-lighting station for the sum of 6,649*l.* The architects are Messrs. G. & I. Steane, and Mr. R. Hammond is the consulting electrical engineer. The buildings are to be commenced at once, and the necessary power and plant, with mains through the principal streets, are to be installed simultaneously.

IT is stated that Mr. Assheton Smith is having a survey made with the view of constructing an electric railway to the summit of Snowdon.

AT the meeting of the Bedford Urban Sanitary Authority a report submitted by the electric-light committee was adopted. It recommended "That application be made to the Local Government Board for sanction to borrow the sum of 12,000*l.* for providing the necessary buildings, machinery and plant for supplying electrical energy within the borough for all public and private purposes, in accordance with the plans and estimates prepared by Mr. F. H. Medhurst."

NOTES ON NOVELTIES.

Adams's Patent Sewage and Liquid Lift.—We give an illustration of one of the latest additions to the science of sanitary engineering in the apparatus known as the Adams's patent sewage lift, as constructed by the Adams's Patent Sewage Lift Company, of 5 and 7 Old Queen Street, Westminster, and of York. By this apparatus the high-level sewage of a district at one point is utilised to raise the sewage from a lower area at

country, unless artificial means be resorted to to obtain the required "head." We have had the opportunity of personally inspecting the apparatus, and Messrs. Adams may claim the credit of applying the principle of raising liquid by liquid to the present purpose, *i.e.* of raising sewage at one point by a "head" sewage at another point.

The apparatus itself is extremely simple. It consists at the higher level of a flush tank A, fitted with Messrs. Adams's patent sewer flushing syphon. This syphon is so well known

another point, entirely without the use of steam-engines or other like motive power; any sewage thus lying below the outfall is automatically raised thereto. An essential factor, however, where this apparatus is employed is the existence of an available "head" of sewage (or liquid) at another point, wherewith the low-lying liquid may be raised; this then makes the adoption of the lift impracticable in perfectly flat

as hardly to need description in detail. The liquid, however, collects in this tank; the air within the syphon is gradually compressed by the rising liquid (as it cannot escape through the deep-water seal at outlet). The air thus compressed resists the pressure of liquid, which thus rises above the syphon to pass through the syphon, as it otherwise would, until the syphon itself is completely submerged and liquid stands some inches

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London and Contractor.

above it. The increasing weight of the water now forces the syphon, the compressed air is driven up the vent-pipe and the syphon comes into instant operation—full bore—delivering its contents to the pressure-pipe, which in turn fills the receptacle B. The air from this receptacle is thus expelled and forced through the air-pipe to the receptacle or forcing-chamber C (this chamber is already full of the sewage to be raised, which has entered from the storage tank through the flap-valve shown), and the contents of C are thus forced up the rising main to the outfall sewer at D, at the height required. The operation over, the forcing-chamber C becomes full of air, and the air-chamber full of liquid. The automatic valve on the air-chamber now comes into operation and liberates the liquid therefrom, closing again when the chamber has become empty. The operation of filling and forcing is then continued indefinitely and absolutely automatically, at no cost for maintenance and at but a slight original outlay. The automatic valve on the air-chamber is so constructed that it is closed under the pressure of the column in the pressure pipe, opening by an increase of pressure when the pressure pipe becomes more fully charged, and allowing the contents of C to flow out.

The illustration gives a general plan of the system. At B is the higher level, with available head of sewage; A is the flush tank in which this collects, and whence it is discharged to air-chamber B, driving in turn, and under pressure, the air from this to forcing-chamber C, and C's contents up the rising main to the outfall at D. The flap valve between C and the storage tank prevents the return to storage tank of sewage from C, when the pressure is applied from B. The patentees claim for this apparatus that by thus working intermittently any slight loss from leakage of air-pipe or valves is overcome, and that as the sewage is thrown up in bulk more quickly, there is no fear of any settlement or deposit. Naturally the result is the same whatever relative position the vessels may hold to each other, provided only that the pressure column is either equal to or greater than the height through which the sewage is forced, and that there is a natural outfall for the liquid from the air-chamber.

The distance separating the chambers also may be greater or less to suit the conditions of the district to which the system is applied. The Adams lift has many applications, as to raise sewage at one level by sewage at another level; to raise sewage at a low level by water from a canal; to raise sewage at its outfall by the sewage itself for irrigation purposes; to raise liquid chemicals, and to raise water, &c., from basements below

the sewer level. The engraving we publish shows the lift as at work in the company's premises, where liquid contained in the storage tank is raised to the height shown by means of the "head" of liquid obtained from the flush tank; from this it will appear that the air and forcing vessels may be on the same level if need be, the position or level of the air-chamber being determined by the level at which the pressure liquid can be disposed of after doing its work.

LONDON BOARD SCHOOLS.

ACCORDING to the report of the Rev. T. W. Sharpe, C.B., senior chief inspector, on the schools in the Metropolitan Division, the supply of school accommodation in London with certain exceptions is now fairly complete. Year by year, however, several new schools each holding a thousand children are rendered necessary by the annual growth of population. These additional schools are chiefly needed in the outer ring; but the supply is liable to be disarranged even where it has been completed, by movements of the population caused by the erection of artisans' dwellings, as at Millbank, while parents in fairly easy circumstances are in growing numbers taking advantage of Board schools for the education of their children in elementary subjects. The inspector's statement on the general supply of London rests mainly upon statistics which claim to represent the accommodation of existing voluntary schools, reckoned upon the floor space of their schoolrooms and classrooms at an allowance of 8 square feet per scholar; but it is pointed out that some deductions should be made from the totals in respect of each district for the ebbing of population, and for unavailable space in ill-planned rooms which cannot be utilised for teaching without considerable structural alterations. Complaint is made of unnecessary delay in recognising the need of building, in getting out plans and in completing buildings; and it is stated that the generally correct basis upon which the School Board relies for its calculations of supply leads to results which do not always fairly represent the actual needs of a locality. Upon this matter there has been much conflict between the parties on the Board. Mr. Sharpe's opinion is that a deficiency of accommodation in one block of streets cannot always be met by a surplus in a neighbouring block. He suggests that where the deficiency, though real, is small and not capable of exact calculation, a temporary iron building

of a sufficiently substantial character, or the conversion of two or three contiguous houses into a temporary school, is the readiest and most economical plan of testing the real deficiency.

On the subject of buildings we are told that the searching inquiry which is being made into their condition has brought to light a large number of serious defects, but nearly all of these can be remedied without any violent structural alterations. The chief want of Central London, however, is in Mr. Sharpe's view, proper playground accommodation. There are very few schools in which some form of drill has not been adopted. Swedish drill requires a playground or central hall for its full development, and for this reason an adaptation of the drill to the confined space of the schoolroom has been found necessary in the schools which do not possess fair-sized playgrounds. The effect produced upon the carriage and discipline of the scholars by the drill is remarkable, although the conditions of limited space have been unfavourable, some of the playgrounds which have been utilised being little better than large yards. In the whole of Westminster there are not more than four or five schools that are equipped with good playgrounds. In the crowded neighbourhoods the Board schools possess external spaces which are exceedingly small, while the voluntary schools have no playground worthy of the name. Even in the largest of London playgrounds the great number of scholars is a bar to healthy running and to games which can be played by any large number of boys. It is fortunate that there is in most parts of London a park or some open space where the older scholars may have greater freedom out of school hours, but, as the inspector advises, in school time even the smallest space should be utilised for fresh air for refreshing the lungs and regaining the temper.

AUSTRALIAN TIMBER FOR PAVING.

It will be good news for the ratepayers of London to learn that there is a chance of obtaining a quantity of Australian timber for paving without having to pay for it. The following official note on the subject has been sent to the Victorian Government by Mr. C. S. Perrin, the conservator of forests:—

In the matter of red gum blocks for street paving in England and the great cities of the Continent, I have the honour to submit the following suggestions. Red gum blocks can be procured from Gippsland of the very best quality (*Eucalyptus rostrata* and *Eucalyptus tereticornis*) at the rate of 9*l.* 5*s.* per

1,000 blocks, delivered f.o.b. at Williamstown, and for 3*s.* less per 1,000 at Port Melbourne. It is quite true, as stated by the Hon. Mr. Reid in his cablegram of March 13, that there is no demand for paving blocks from the colony at present; but I am aware of a general feeling existing among the great Corporations of English and Continental cities as to the desirableness of making some change with regard to the use of soft wood for street paving purposes; hence our hard woods are bound, in the very near future, to command extensive notice from their suitability and durability for the purpose named. Western Australia has for years past sent to London paving blocks of jarrah (*Eucalyptus marginata*). Tasmania has commenced to send blocks and other timber of blue gum (*Eucalyptus globulus*). In my opinion, it is highly desirable that Victoria should be represented in the competition between the colonies for what will be an immense trade in wood blocks.

The West Australian jarrah is well known in the markets of the Old Country, whilst commercially it is the reverse with our red gum, which is practically unknown except to the experts of the Royal Dockyards and a few merchants to whom occasional shipments have been sent. From inquiry I now find that the Murray gum (*Eucalyptus rostrata*), or river gum, is not suitable for paving, and the Metropolitan Board of Works now, after considerable trial, give the preference to Gippsland red gum of the species known as *tereticornis*. The former is full of gum veins and liable to dry-rot, &c., and does not stand the heavy traffic in consequence. I have therefore to recommend that a trial shipment of 5,000 blocks be obtained from Messrs. Quiggin Bros., of Flinders Street, whose mills are situated near Bairnsdale, at a cost, as previously stated, of 9*l.* 5*s.* per 1,000 delivered free on board at Williamstown, or 9*l.* 2*s.* per 1,000 at Port Melbourne, f.o.b. Mr. Martin, secretary for agriculture, whom I have seen, has promised to reserve space for 5,000 blocks if sent in time for the National Show in June next, and these could be shipped with other exhibits.

After the show I would suggest that the blocks be handed over by the Agent-General to the London County Council or other body interested in street paving in London, to be situated in such a place as will provide tests and data for proving the superiority of red gum to West Australian jarrah and Tasmanian blue gum. In fact, a trial space might be laid down in which all the Australian woods could be tested and practically valued as street paving material.

The blocks can be obtained now, and if these suggestions be approved the order can be given at once, and the timber

sent to Mr. Martin for shipment with the other exhibits. I would suggest that in the laying down of these blocks in the streets asphalt be used in place of cement. The former allows for contraction and expansion in cold and hot weather and the latter does not, whilst asphalt also acts as a preservative of the wood. In Melbourne cement has been chiefly used.

PATENTS IN 1893.

THE report of the Controller-General of Patents for the year 1893 has just been presented to Parliament. The number of applications for patents during the year exceeded that of any previous year, having amounted to 25,120, or an increase of about 4 per cent. above the number of applications in 1892. The number of applications has grown steadily since the Act of 1883. In 1884 there were 17,100; the next year, 1885, there was about 100 less, but with that exception the increase has been steady.

The greatest number of applications under the old Act of 1852 was in 1882, when the number was 6,241, or about a quarter of the present number. From 1852 to 1882 the growth had been almost continuous, and had increased from 2,764 in 1854 up to the number given above in 1882. The total number of patents sealed from the date of the passing of the Statute of Monopolies in 1623 down to the passing of the 1852 Act was 13,561. How far this enormous increase in patents for inventions represents any genuine growth in the inventive faculty it would be difficult to say.

The report notes that recent years show a considerable increase in the number of complete specifications filed with the applications, and that every year the number of applications accompanied by provisional specifications, which are allowed to lapse through omission to provide complete specifications, becomes relatively larger. The reduction in the scale of renewal fees, sanctioned in 1892, has caused a small increase in the number of patents kept in force.

The number of patents which perish in the later stages seems to be as large as ever, and the proportion of those which die in the earlier stages appears to be increasing very rapidly. In 1877, 65·8 per cent. remained in force for three or four years. In 1892 the percentage had dropped to 47·8, the decrease being fairly steady throughout that period.

It is a remarkable fact that more than half the patents

applied for are now allowed to perish at so very early a stage in their existence. Of the applications of 1880 only 6 per cent., or 222 out of 5,717 applications (made under the 1852 law) still survive, having lasted the full period of fourteen years.

So far as the tables enable a judgment to be formed, an equal percentage of the patents taken out under the existing law survived to the later stages, although a much larger proportion perished in the first stage. For instance, of the 1886 patents 15·4 per cent. are now in their eighth year, and the percentage of the 1877 patents alive at the same period was 14·2.

The applications for designs show a steady falling off during the past six years, and the same remark applies to the applications for the registration of trade marks. With regard to these there was a steady increase on the passing of the Act in 1883 up to 1888, when 13,315 applications for registration were made. Since then there has been a steady falling off, the number last year being 8,675. The total earnings for the year amounted to 174,877½. The surplus for the year was 79,774½.

CHURCH BUILDING AND RESTORATION.

HEYDON, NORFOLK.—The fine old parish church of SS. Peter and Paul is now about to undergo partial restoration, the principal works being the restoration of the nave and aisle roofs, which have been found to be in a decayed condition, re-using, however, every part of the old woodwork found practicable, taking off and recasting the lead, reglazing the clerestory windows, restoring the copings and walling, rebuilding the east gable, and replastering the internal walls. Part of the amount necessary for carrying out the restoration has been obtained, but further funds are still needed. Mr. T. H. Blyth, of Foulsham, is the contractor, and the works are under the superintendence of Mr. Herbert J. Green, architect, Norwich.

THE Chester Town Council last October selected a site for an electric-light station, and at a meeting just held have rescinded their determination. One member remarked that the electric light had already cost them 754½ *gs. 2d.*, and they had nothing to show for it. They were not a bit more forward than they were nine months ago, and if they went on like this they would spend as much money as they could get the electric light for and still be without it.

CEMENTS AND CEMENT-TESTING.*

THE chief qualities which make cement valuable are perhaps the following: setting and hardening properties, constancy of volume, permanence in water and in air, strength under tension and compression, resistance to wear, resistance to frost, impermeability by water and adhesion to brick or stone. Let us now consider the chief uses to which cement is applied, and the special qualities which each use demands. It may be assumed that for all purposes rapid hardening properties and permanence in respect of strength and volume are essential.

1. Mortar and concrete: hardness, strength under compression.

2. Sidewalks and flooring: hardness, resistance to wear and frost.

3. Cistern, reservoir and aqueduct linings: impermeability.

The testing of cements is a delicate operation, and much experience and judgment are necessary in order to secure even fairly accurate results. The methods of testing have been the subject of careful study by experts. In Germany the requirements of the Minister of Public Works are recognised as a standard. In France the requirements of the Services Maritimes des Ponts et Chaussées are generally followed. In America the subject of cement-testing has been carefully considered by a committee of the American Society of Civil Engineers, and their report will be found to contain full and valuable instructions. The German requirements are marked by simplicity, clearness and good sense, and probably represent the latest advances in the field of cement-testing.

We may now take up the chief qualities of cement which it is important to determine, the reasons for the failure of some cements to exhibit these qualities and the methods by which such failure may be most surely and promptly recognised.

1. *Setting and Hardening Properties.*—Cement, when mixed with water until plastic, gradually sets, becoming more or less hard and rigid. Natural-rock cement usually sets in a few minutes, or one-half hour at most. Portland cement requires a longer time, usually from two to eight hours. Cements containing a high proportion of clay, or those lightly burned, are more quick setting than those high in lime or hard burned. The time of setting is most easily determined by making a "pat"

of the cement, about 3 inches in diameter and $\frac{1}{2}$ inch thick, with thin edges, on a piece of glass about 5 inches square. The pat is placed in a tight box or under a damp cloth and tested from time to time, by light pressure with the finger nail, until no noticeable impression is made. The amount of water used greatly influences the time of setting, and different cements require different proportions of water to produce a given consistency. The German requirements prescribe the use of such an amount of water that several taps of the glass on the table or mixing-slab are required to make the pat spread out to the edges. The temperature of the room is also exceedingly important, as cement will set in a warm room in half the time, or less, required in a cold room. The room should be kept as nearly as possible at 70 deg. Fahr. during the mixing and setting, and the water used should be of this temperature. More accurate methods, using a needle one twenty-fourth of an inch in diameter, carrying a weight of 1 lb., are also employed, but are unnecessary for practical purposes.

After remaining twenty-four hours in moist air, or at least over night, the pat is placed in water (kept at 70 deg. Fahr.) and the progress of the hardening noted. Good cement should harden rapidly, and after one day in water should appear perfectly hardened, so that it cannot be scratched or scraped away by the finger-nail. Good Portland cements are slow-setting and quick-hardening. There are many inferior cements which remain soft for several days, though they may become quite hard in time. The best cements are those which gain great hardness within a few days and show no falling-off at long periods.

2. *Constancy of Volume and Permanence.*—The question of the soundness and lasting qualities of cement is perhaps of greater consequence than any other, as the stability of work done with it depends entirely upon this quality. Some cements, though hardening well when first used, show after weeks or months a tendency to swell or crack, often lifting great masses of masonry by their expansion, and after a longer time are found to have fallen completely to powder. The cause of this alarming defect is the presence of free or imperfectly combined lime in the cement, due to too high a proportion of lime in the raw material, or more often to imperfect mixing of the ingredients. The presence of a small percentage of coarse particles of carbonate of lime in the mixture will infallibly produce an unsound cement. This fault is exceedingly liable to occur, since the perfect grinding and mixing of the raw materials are a matter of great difficulty and expense. Free

lime in cements slakes only after long periods, and in slaking expands and causes the hardened cement to crack to pieces. The presence of more than 4 per cent. of magnesia in Portland cement is supposed to produce the same effect. So far as is known, the presence of free lime (or magnesia) in cement is the sole cause of its failure to maintain the strength and hardness at first acquired. As this fault is always the result of expansion, it may be said that cements of constant volume will prove permanent in use.

The usual method of recognising a tendency to expand or crack is the pat test already described. Two such pats should be made and allowed to set; one is then placed in water and the other kept in moist air. The first evidence of bad quality is the loosening of the pat from the glass, which generally takes place, if at all, within one or two days. Bad cement will also show fine radial cracks on the thin edges of the pat, which will also curve up more or less at the edges, presenting a saucer-like shape, and will often become covered with a network of cracks, like alligator-leather. These appearances are usually more marked in the pat kept in moist air. Good cement will remain firmly attached to the glass for two weeks at least, will harden well within two or three days, and will show no cracks, even after a month or more in water. Among the many tests which may be applied to cement, there is none which gives so sure and complete an indication of its quality as this simple pat test on glass; time of setting, hardening qualities, and permanence are thus determined in a single operation.

The hot test for the quick detection of any tendency to expand or crack has come into extensive use within the past few years, and has proved to be of great value. The test consists in exposing a pat of cement, prepared on glass as described above, to the action of steam for about three hours, then allowing it to lie in boiling water for an equal time. The presence of a very small proportion of free lime will cause the pat to swell and crack under this treatment, and sometimes to fall completely to powder, while perfectly sound cements will remain on the glass and harden well, showing no sign of cracking. The Association of German Cement Makers has refused to endorse this test, claiming that it is too severe, and that its use would condemn many cements which prove perfectly sound in practice. There is, however, a very close connection between cracking under the hot test and failure of the cement after long periods, and there can be no doubt that both result from the presence of free lime, chiefly due to imperfect mixture of the materials. It is certain, also, that proper care

in manufacture will produce cement which will stand the hot test perfectly, even very fresh. The use of the hot test is a great safeguard to consumers, as a cement which stands this test well may be relied upon to prove perfectly sound and permanent for all uses in water as well as in air.

After prolonged seasoning or exposure to air, most cements which show a tendency to crack when fresh will be greatly improved and may become perfectly sound, owing to the gradual slaking of the free lime present. It is not well, however, to rely too much on this method of cure, as the final destruction of the work is often only postponed by this process. Such seasoned cement will rarely stand the hot test and becomes more dangerous, owing to the fact that its unsoundness may escape detection by the cold pat tests usually employed.

3. *Strength under Tension and Compression.*—Tensile strength is determined by making up briquets of the cement, both neat and with sand, and pulling them apart on a testing-machine after a certain period in water. In Germany the only test officially recognised is that of cement with three parts of sand, broken at twenty-eight days. In this country neat tests at shorter periods are also generally made. The results of these tests depend to a surprising degree on the conditions under which the briquets are made, and no one can hope to obtain uniform or just results without practice and careful observation of many minute precautions.

The temperature of the room in which the briquets are made and also that of the water used for mixing and that in which the briquets are allowed to lie, should be kept as nearly as possible at 70 deg. Fahr. The effect of this is seen especially in the results at short periods. A sample of cement which shows a strength of 150 lbs. after twenty-four hours, when the briquets are made and allowed to set in a warm room, will generally show less than 50 lbs. if kept in a room near the freezing-point.

The amount of mortar used should be such as to produce a uniformly plastic plaster. Different cements require different amounts of water; for quick-setting natural-rock cement at least 30 per cent. of water is necessary, while with Portland cement from 22 to 25 per cent. will be found sufficient. The use of more water than is necessary to produce a fairly plastic mortar greatly weakens the briquets.

The manner of mixing the mortar greatly affects the results, as the longer the mixture is worked with the trowel up to a certain point, the greater strength the briquets will show. The

cement and water should be mixed on a slab of slate or marble, and worked thoroughly with a trowel for at least five minutes. A good plan is to rub enough mixture for each briquet in a large porcelain mortar for a few moments. If this practice is adopted it should be uniformly adhered to.

The moulds should be slightly oiled or soaped on the inside. The mortar is then pressed into them as firmly as possible with the thumbs, rubber thumb-caps being used to protect the hands. The consistency of the mortar should be such that a firm pressure can be used. Pounding the mortar into the moulds will give higher breaks, especially if only 18 to 20 per cent. of water be used, but is not to be recommended, as uniform results cannot be obtained by this method. The surface is smoothed off with the trowel and should appear wet and plastic. The moulds are then turned over, filled and smoothed off on the other side. The briquets are then placed under a damp cloth and left until set before the moulds are removed. With quick setting cement two hours will be sufficient; with Portland cement the moulds should not be removed until the next day. In all cases the briquets should be left for twenty-four hours in air before placing in water.

Sand tests are usually made with one, two or three parts, by weight, of sand. With three parts of sand, water to the amount of 10 per cent. of the total weight of cement and sand will be found to give the best results, and this proportion is specified in the German requirements. The character of the sand used greatly affects the results. In Germany a natural sand from Freienwalde-on-the-Oder, passing a sieve of 20 meshes to the inch and remaining on one of 30 meshes, is recognised as the standard. In the United States crushed quartz of the above fineness is generally used, as recommended by the Society of Civil Engineers. This is made by several manufacturers of sandpaper. Ordinary building sand will generally be found to give rather higher results than the standard sand, as the varying size of the grains leaves less space to be filled with cement. In making sand briquets, thoroughness of mixing is even more essential than in neat tests. The German requirements specify that the mixture of cement, sand and water shall be strongly worked for five minutes. The writer lately tested a cement with three parts sand, and found that, after working the mixture one minute, a tensile strength of 87 lbs. in seven days was obtained, while the same mixture, strongly worked for five minutes, gave a strength of 240 lbs. in the same time.

In making sand briquets a certain amount of pounding is

necessary. The German requirements recommend the use of an iron spatula weighing 250 grammes. Uniform results may generally be obtained by filling the moulds above the top, laying on a piece of wood, and gently pounding with a hammer or mallet. In actual work the proportions of cement and sand are always measured (usually by shovelfuls), not weighed. As cement is 50 per cent. heavier than sand, allowance must be made for this in estimating the value of various mixtures for practical purposes. One part of sand by weight is equal to $1\frac{1}{2}$ parts by measure. Briquets of 1 cement to 3 sand therefore represent the strength which may be obtained in practice from mixtures of 1 cement to $4\frac{1}{2}$ sand by measure.

In judging the results of tests of tensile strength it should be remembered that steadily increasing strength at long periods is better proof of good quality than high results during the first few days. The behaviour of the cement in the pat test and hot test should also be considered in this connection. Cements which are very high in lime, and even those showing a slight tendency to expand and crack, often show astonishingly high breaks at one day and at seven days. This appears to be due to a condition of strain, and is nearly always followed by falling off in strength when tested at twenty-eight days and longer periods.

Natural-rock cement, neat, will generally show 50 to 75 lbs. in seven days, and 100 to 200 lbs. in twenty-eight days. Good Portland cement, neat, will show from 100 to 200 lbs. in one day, 400 to 600 lbs. in seven days, and 600 to 800 lbs. in twenty-eight days. With three parts sand, Portland cement should give at least 100 lbs. in seven days, and 200 lbs. in twenty-eight days. The German requirements specify that cement, with three parts sand, shall show a strength at twenty-eight days of 16 kilogrammes per square centimetre, corresponding to 227 lbs. per square inch.

Compression tests are rarely made in America owing to the rather costly apparatus required. Such tests are, however, of great value in determining the suitability of cement for important work. In general it has been found that the results of compression tests, both neat and with sand, are about ten times as high as tensile tests on the same section. Natural-rock cements give generally relatively lower results in compression tests.

4. *Resistance to Wear, Impermeability, &c.*—The tests for time of setting, constancy of volume and strength under tension and compression are the only ones generally made, since these qualities vary greatly, even in different samples of

cement of the same make. The other essential qualities of good cement, such as resistance to wear, resistance to frost, impermeability by water, and adhesion to brick or stone, are not liable to great variations, and it may be assumed that any cement which stands the usual tests will give satisfactory results in all other respects.

Tests of the comparative power of different cements and mixtures of cement with sand to resist wear have been made by Professor Böhme, head of the royal testing-station for building materials in Berlin. His apparatus consists of a rotating cast-iron table sprinkled with emery powder, upon which cubes of cement are ground for a given time under constant pressure. Neat cement is found to be greatly inferior in wearing qualities to mixtures of cement with sand, being, in fact, about equal to a mixture of 1 to 3½ parts. The best wearing qualities are shown by a mixture of 1 part cement to 1 part sand (by weight); practically equal results are obtained with a mixture of 1:2. These facts have an important bearing on the use of cement for sidewalks and flooring. The greatest fault met with in sidewalk work is the occurrence of long irregular cracks across the blocks. This fault is usually attributed to the poor quality of the cement or to frost, but it is solely due to slight shrinkage of the cement in hardening, and occurs with the best and hardest cements when the proportion of sand employed is too small.

As for resistance to frost, little or no hardening takes place at temperatures below freezing, and partially hardened cement, saturated with water, is liable to suffer much in strength by being frozen. After thawing, however, the hardening proceeds again, and in most cases no serious results from freezing are apparent. The addition of salt to the mortar, often practised, is harmless, and in some cases may be of value. The chief point to be observed in using cement in winter is the sparing addition of water; in fact, an excess of water is in all cases injurious, as the strength of the work is greatly weakened by it. Probably in nine cases out of ten masons add far more water than they should, from either carelessness or a desire to avoid the greater labour of working less fluid mortar. The best results are always obtained by making a mixture of cement and sand not wetter than moist garden earth. No water should be visible until the mixture is well trowelled or pounded. If this precaution be observed, cement work may be carried on in the coldest weather without bad results.

5. *Impermeability.*—Cement is extensively used as a water-proof material, especially in lining cisterns, aqueducts and

reservoirs. The impermeability of cement mortar increases greatly with age, so that comparatively porous mixtures will become quite dense in time. For linings which are to be immediately waterproof not more than one part of sand (by weight) to one of cement can safely be used. A mixture of one cement to two sand will, however, prove impermeable after the lapse of a few weeks. The addition of slaked lime to the mortar greatly increases its density, and also increases the strength of mixtures poor in cement. In concrete work a mixture of one part of lime, previously well slaked, one part Portland cement and six parts sand will be found to give as good results as two parts cement to six of sand, the lime thus replacing half the cement without causing loss of strength. Used in this manner Portland cement will be found much cheaper than the natural-rock cements for ordinary uses. For waterproof linings a mixture of one part cement, one-half part slaked lime, and three parts sand, or even one cement, one slaked lime and six sand will be found sufficiently impermeable. It has also been found that the addition of slaked lime to cement-mortar greatly increases its adhesion to brick or stone. Masons often object to using mixtures of cement with three or more parts sand as mortar for brickwork and masonry, on account of its working "short" under the trowel. Increasing the proportion of cement is extravagant and unnecessary. The objection can be overcome by adding one part of slaked lime, which will make the mortar "fat," plastic and easy to work.

COUNTY COUNCIL EXTRAVAGANCE.

THE *Local Government Journal* calls attention to the fact that the original estimate for the Parker Street Lodging House, built by the London County Council, was 11,000*l.*, while the actual cost, as admitted by the Chairman of the housing committee on Tuesday, was 21,000*l.* The fire station at New Cross Gate, which was publicly opened on Saturday, is another specimen of extravagance. The contractor's price was 14,700*l.*, or 1,600*l.* below the architect's estimate. This was not accepted, and the Council, in order to give the works committee an opportunity to justify its existence, gave the job to them, with the result that they have spent 20,000*l.* on work which a contractor offered to do for 5,300*l.* less. More than this, during the last twelve months about 400 accounts for works have been submitted by this committee at the various fire stations, and in every case they were above the architect's estimate, some of

(Between Gower Street and Portland Road Stations).

NEW SHOWROOM NOW OPEN. IMMENSE STOCK OF BATHS.

THE

Architect and Contract Reporter.**SPECIAL NOTICE TO THE TRADE AND OTHERS.**

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

THE city authorities of Newcastle-on-Tyne have given instructions to Messrs. W. Potts & Sons, of Leeds and Newcastle, to take down the present clock from St. Nicholas' Cathedral and place the same in the tower of All Saints' Church in that city, and to make a larger and more powerful clock and chimes for the cathedral suitable for the large new bell recently erected in the tower; also to have the large bell used to denote the time of day, by circuit wire from Greenwich Observatory at one o'clock daily instead of the signal-gun, which was discontinued some time ago. The above clock when completed will be the largest in the kingdom, Messrs. Potts having already put the work in hand. They have also the large clock with four 11 feet 6 inches illuminated dials in hand for the New City Hall, Sheffield, and a large clock with two 6 feet illuminated dials and bell for Messrs. Reckitt, Sons & Co., Limited, Hull.

BUILDING AND BUILDERS.

THE cost of the proposed new infirmary for Paisley is estimated at 32,000*l.*, exclusive of cost of site, furnishing, and fees. A sum of 15,000*l.* is required to supplement the bequest of the late Mr. W. B. Barbour and donations of other friends.

At the sitting of the Edinburgh Dean of Guild Court warrants were granted to Mr. William Gerard to build a villa at North Park Terrace, and to Pape's Trustees to build three almshouses at Coltbridge. Professor Patrick Geddes was given leave to remove the stable and existing buildings at the corner of Watergate and the North Back Canongate, and erect a tenement of shops and artisans' dwelling-houses of two rooms each. The building is to have five storeys looking towards Watergate, and four storeys towards the North Back Canongate.

In the Partick Dean of Guild Court, Messrs. J. & W. R. Thomlinson were granted lining to erect two tenements of dwelling-houses in Dumbarton Road, immediately to the west of the railway bridge. The estimated cost is 8,000*l.* Mr. Peter M'Kissock, Glasgow, also received permission to erect two villas, to cost 3,000*l.*

THE death is announced of an old and well-known builder in Shropshire, Mr. John Vaughan, of Sandford, West Felton.

At a meeting of the Anglesey joint police committee at Llangefni, Mr. O. Morris Roberts, architect, submitted amended and modified plans of the county buildings proposed to be erected, which could be carried out at a cost not exceeding 5,500*l.* or 5,600*l.* as estimated. It was decided that application be made to those builders who had previously tendered for tenders on the amended plans.

SELECTED DESIGN FOR NEW MEAT MARKET AND SLAUGHTER-HOUSES FOR THE CITY OF BIRMINGHAM.

TRADE NOTES.

TWO west windows have been inserted at St. Stephen's Church, Willenhall, containing figures of St. Peter and St. Paul, from the studio of Mr. T. W. Camm, Smethwick.

THE parish church clock of Woodstock has just been thoroughly restored by Messrs. John Smith & Sons, Midland Clock Works, Derby. Four new dials, with hour and minute hands, have been fitted in place of the old dials, which had hour hands only. The same firm made the clock at Bladon Church, which is also quite close to Blenheim House.

THE new Cottage Hospital, Dartford, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

AT the meeting of the Bath Town Council a report was presented from the special committee as to the sewage disposal. They reported that they had entered into provisional contracts with the owners of a site which might be suitable for a chemical precipitation. They advised that the question referred to them by the Council, as to the levels of the new intercepting sewers, should be referred to the expert as part of the whole matter referred to him. They recommended the Council to engage the services of Mr. W. H. Radford, C.E., of Nottingham. It is expected that the sewage of Bath will have to be collected by means of intercepting sewers, and conveyed to one outfall for purification. The scheme has been estimated to cost between 70,000*l.* and 80,000*l.* The population of the city is about 52,000.

IN last week's *Architect* an illustration of the School Board Offices at Reading appeared. We are pleased to state that Milner's Safe Company, Limited, supplied the iron doors for the strong-rooms, as they also did for the Mansion Ballard Coomb.

WE understand that Messrs. Winfields, Limited, of Birmingham, in consequence of the expiration at Midsummer of the lease of their present premises in Farringdon Street, London, are removing their London sample room to No. 30 Snow Hill, E.C., being directly opposite the present premises. The London business will continue to be under the direction of Mr. Seymour Croneen, and arrangements are being made for the display in the new show room, of an entirely fresh selection of samples, including the latest designs in gas and electric light fittings, bedsteads and cots, and general brassfoundry.

WE hear that Messrs. Charles Erith & Co, heating, ventilating and drying engineers, have, owing to the rapid development of their business, both in this country and abroad, removed their head offices from 13 Little Trinity Lane to more central and convenient premises at No. 70 Gracechurch Street, E.C. (close to Fenchurch Street), where all future communications should be addressed. They will continue to hold a large stock of their well-known hot-blast apparatus and other specialities at their London and provincial warehouses, ready for prompt delivery.

AMONG the exhibits at the Show of the Royal Agricultural Society, held this year in Cambridge, is one by Mr. Henry Hope, of Lionel Street, Birmingham. Included in his exhibit is a span-roofed vinery, 30 feet long by 15 feet wide, to be built on wall 2 feet 6 inches high above floor line, with two glass ends, one fitted with door. It is constructed of the best well-seasoned red deal, the roof being braced with strong cast-iron spandrels and wrought-iron cross bars. Cast-iron gutters are fixed on the eaves, with down pipes to the ground level. Ventilating lights are hung the whole length of each side and along one slope of the roof, and each set is worked simultaneously by shafting and screw gear fixed at one end of the house. All the lights and the door are hung on strong brass hinges, the door being fitted with brass mortice lock and furniture. The interior of the house is fitted with strong wire trellis of the most approved form for training vines to.

THE proprietor of the Westgate New Arcade, Bradford, Mr. Hy. Lingard, has placed a new illuminated turret-clock in the front of his extensive premises with all Lord Grimthorpe's latest improvements inserted, the work having been executed by Messrs. W. Potts & Sons, clock manufacturers of Leeds and Newcastle-on-Tyne.

VARIETIES.

MESSRS. FREDERICK WALTON & Co., Limited, of Newman Street, W., who have brought out various applications of their Lincrusta Walton, which rival one another in beauty and utility, have just added a new ceiling design, "The Conqueror," to their collection. It forms a geometrical pattern which, from its lightness and simplicity, is specially adapted for a horizontal application. This ceiling covering is remarkably cheap, for it can be obtained at the sum of a shilling a yard, a price which will enable it to be used in the cheapest houses. The ceiling decoration can be obtained in ivory-white and special buff, but other tints can be employed if desired.

A MEETING of the Building Trades' Federation was held in Hyde Park on Sunday last. The following resolution was unanimously adopted at each of the five platforms:—"That this mass meeting of building trade workers considers the time has arrived for the return of members of the building trades on all local and municipal bodies within the London district to press forward the enforcement of the provisions of the agreement of June 1892 by the insertion of the trade union clauses in all contracts; and, further, we pledge ourselves to use every legitimate means at our disposal for the direct employment of labour, under trade union conditions, by all local and municipal bodies."

THE London, Brighton and South Coast Railway Bill, authorising the company to make a new line from Coulsdon, near Reigate, to South Croydon, to avoid slow trains impeding the fast ones, has passed through Committee in the House of Lords. New capital powers of 480,000*l.* are authorised.

THE King of the Belgians paid a special visit to the Antwerp Exhibition last week to inspect the very elaborate glass exhibits on view there. The fine display of extra quality window glass shown by the Red Star Glass Works Company attracted his special attention, and the manager of this well-known company had the honour of being presented to his Majesty, who graciously evinced his interest in the manufacture by making various inquiries, as to the number of hands employed by the company, the progress made by them, &c.

THE Local Government Board have held an inquiry at Birkenhead into the application of the Corporation for sanction to borrow 35,000*l.* for electric lighting, sewerage purposes, and the erection and equipment of a fire-station.

PLANS have been prepared for a road bridge over the river Severn at Newnham. The river is nearly 600 yards wide

at the place which is regarded as the most favourable for throwing the bridge across, and a high-level bridge is recommended. The estimated cost is 25,000*l.*

AT Enfield on Wednesday next Messrs. E. & H. Lumley will put up for sale by auction the valuable freehold building estate known as Gough Park, at the junction of Forty Hill with Clay Hill, comprising fifty-nine plots of grandly-timbered building land, forming most admirable sites for large or small residences. The existing old-fashioned residence, with stabling, &c., will also be offered. It is within an easy distance of London, and is served by two railways, the distance from town by road not exceeding ten miles, in a part of the county of Middlesex which is remarkable for the beauty of the scenery.

THE CARPENTERS' COMPANY.

THE annual examination for shop and outdoor foremen, &c. was held at Carpenters' Hall on June 20 to 23. Among the examiners were, as usual, such well known men as Mr. F. C. Penrose, P.R.I.B.A., Professor Banister Fletcher, F.R.I.B.A., Professor T. Roger Smith, F.R.I.B.A., &c. Of the candidates who presented themselves the following passed. We have arranged them in order of merit:—

NOTES ON NOVELTIES.

Macadam Road Scarifiers.—Great interest was evinced in the trial of two road scarifiers at West Hampstead, and the result proved eminently satisfactory in regard to one of the machines, Rutty's improved patent macadam scarifier. This machine, invented and patented by Mr. George G. Rutty, contractor, of Bromley-by-Bow, was the first machine used for breaking up macadamised roads preparatory to recoating with broken granite. It was used first on the Victoria Embankment eight years ago, and has been used there every year since for this class of work. The trial at West Hampstead took place in the top portion of Iverson Road, under the supervision of Mr. A. Rutty, and the machine, which comprises no fewer than six patents, justified its reputation in every way. It is very simple in construction: the body is of cast-iron, hollow in the centre, and has three cast-steel teeth at each end. These teeth are a foot long and 2 inches in width at the top, tapering to a point. The centre of the body rests on an axle with a small wheel at either end, and there is a wheel at the front and back of the machine. By means of screws at the back and front the ends of the machine may be raised or lowered whilst still travelling, and as the machine is made to slide on the axle, it can be made to work close up to the kerb or channel next the footpath. The machine will work both forwards and backwards, only the teeth at one end being used at a time, and thus there is no necessity for turning the machine round. The depth of material to be broken can be regulated by means of the screws, from 1 to 3 inches as required, and by the same means plug-holes, man-holes or paved crossings can be avoided while the machine is in motion. The weight of the machine is about two tons. It can be drawn by a six-horse power traction engine or by a steam-roller, and the fact that an ordinary steam-roller can be used for drawing it makes it a convenient and economical machine for local authorities.

NEATH PUBLIC WORKS.

MAJOR-GENERAL C. PHIPPS CAREY, R.E., held an inquiry on behalf of the Local Government Board on the 22nd inst. respecting an application of the Neath (South Wales) Rural Sanitary Authority for sanction to the borrowing of sums of 13,000*l.* for sewerage works at Skewen, and 1,300*l.* and 600*l.* for works of water supply for the contributory places of Blaen-hond-dau and Resolven respectively.

The details of the schemes were explained by the engineer to the Board, Mr. W. E. Clason Thomas, Assoc.M.Inst.C.E. The former scheme comprises between 7 and 8 miles of sewers, including 1,080 feet of tank-sewer of a sectional area of 36 square feet (capacity 243,000 gallons), with a tidal outfall into the river Neath. The system of back drainage has been adopted throughout, and by the arrangement of certain man-holes the ventilation will be entirely cut off between one portion of the district and another, each district having its separate supply of fresh-air inlets and extraction shafts, thereby preventing the gases accumulating and ascending to the higher portions of the district. Automatic flushing is provided at all dead ends by utilising the various sources of supply from springs and streams and the provision of a 19,000-gallon flushing reservoir at the Mooretown end of the district. The outfall sewer is 18 inches in diameter and passes under the Tennant Canal, where, owing to the restrictions laid down by the owner of the canal, an inverted syphon has had to be provided; then it takes a straight course to the Clydach river, over which it is carried for 100 feet in an iron box girder on iron piers, thence through the marsh until it reaches the tank storage sewer.

The Sanitary Authority are empowered under the Neath Corporation Water Bill (which has just passed the House of Lords) to purchase that portion of the existing waterworks which lies in their district, and which has a separate supply from that of the Corporation. The loan of 7,000*l.* required for the purpose is sanctioned by the Bill, and it is now proposed to enlarge the sources of supply, build a new service reservoir and lay several new mains in the district, plans for which will shortly be laid before the Board.

THE PROGRESS OF ELECTRIC LIGHTING.

THE position now reached by the electric light as one of the necessities of our everyday life, and the increasing tendency of the public to take it for granted that they can always have it ready at hand, makes one somewhat apt to forget the time when electric supply was unheard of. But the public memory is proverbially short. The general use of electric light has been a plant of slow growth, but it would not have been so slow if electrical engineers had taken more pains to use their art to the best effect. We have recently had an opportunity of seeing some of the results achieved by the Electrical Instal-

lation Company, Ltd., of 66 and 64 Victoria Street, S.W., in overcoming the prejudices of those who associate electric light with strange devices in brass and copper, leaf-work lilies growing upside down from the ceiling, from which hung cut-glass things called shades, from whose dazzling rays there was no escape. People went to their clubs and returned vowing that they would never have electric light in their homes. But now, in view of the taste displayed by the Electric Installation Company in the work they have carried out both in town and country, there should be no excuse for these barbarities. If there still exists any idea that electric light is dangerous, it is probably due to the disgraceful way in which the wiring of buildings is too often scamped, on the principle of out of sight out of mind.

Still, so far as the internal arrangements of a house are concerned, this is the most important point of all, and we are therefore well pleased to learn that the Electric Installation Company's method of wiring is being greatly approved of by leading architects, who recognise its many advantages, viz. elimination of joints, accessibility for alterations and additions, ease with which faults can be detected and located, moderate cost.

The company have recently completed a most successful installation for Lord Stratheden & Campbell at his seat in Roxburghshire, the dynamo being driven by water-power, and supplying not only the house and stables and a battery of Epstein cells as a reserve, but also providing the current if required during the day for an electric motor erected at the home farm. Among other business the company has secured in the City we may notice the large block of offices in Great Trinity Lane, for the lighting of which they are responsible. The Electric Installation Company are constantly bringing out fresh novelties, and one of the most ingenious things we have lately seen is their table-connector, by means of which candelabra fitted for electric light may be placed on any dinner table without any unsightly wires showing. Any number desired can be used and placed in any position. Moreover, the candelabra can still be used for candles if required.

Their "Safety Wall Plug" (patent) for connecting movable lamps to the source of the current, is the most compact yet devised, and will commend itself to both architects and electrical engineers.

In spite of the depression in trade, of which so much is heard, we note that the Electrical Installation Company have opened a branch in Edinburgh at No. 30 St. Andrew Square, and have appointed Mr. J. H. Mackail to be their district superintending engineer for that city.

THE LONDON COUNTY COUNCIL AND NON-UNION LABOUR.

A CORRESPONDENT of the *Times* writes:—In the *Times* of May 2 reference was made to the fact that a vote was about to be taken among the members of unions in the Building Trades' Federation to say whether or not a general strike of the workmen employed by the London County Council should be declared with a view to secure the dismissal of a certain foreman at the Belvedere Road works who had refused to join the union. The threatened strike has not come off, however, the foreman in question having since joined the union rather than attempt to try his strength with the forces that would otherwise have been brought to bear against him. This particular incident, therefore, may be regarded as closed. All the same, it is regarded as significant of a state of things in connection with London County Council work, against which a vigorous protest is now being made. It is declared to have become "a recognised thing" in the building and kindred trades that there is no hope of a man being employed on a London County Council "job" unless he can produce his federation ticket. Such ticket is regarded as the *sine qua non* of employment. The question of the moment, therefore, reduces itself to this—Should not a non-union worker have as good a chance of obtaining work under a public body like the County Council, supported as it is out of the rates, as a member of a union? The reply made by the defenders of the County Council is, in effect, that the critics of that body are wrong in their facts. The onus of proof, therefore, falls on those who make the protest, and they so far accept the responsibility that they have formed a deputation which will wait upon the Works Committee of the London County Council and put before them some of the proofs on which the allegations are based. The deputation is limited by the committee to ten persons, but no fewer than seven of these will be men prepared to state positively that they themselves have applied for work under the County Council, and have been refused employment because they were non-unionists. It is declared that, if necessary, innumerable other instances could be adduced. Each of these seven men has made a written statement in advance, signed by himself in the presence of witnesses, and setting forth his own experiences. One of the most striking of the statements is that of a general foreman (a person capable of taking full charge of the work of

construction when the architect has prepared his plans), who is now acting in that capacity in the erection of an important vestry hall. His story is worth recording in his own words:—

"In March 1894 I applied with my character to the London County Council to see if they could give me a job as general foreman. I was told to apply to the office of the Works Department, Belvedere Road. I asked to see the manager, and went into a waiting-room. When the manager came to me I asked if he had a vacancy for a general foreman, and told him where I had been working. After some conversation I was asked by the manager whether I belonged to the Building Trades' Federation and whether I agreed with their principles, and, on answering each of these questions in the negative, the manager told me that there was no work for me, and that it was no use applying for work. I am certain that the manager meant me to understand that he could not give me employment unless I belonged to the federation and had their ticket."

One of the other men, a painter, says:—

"In September 1893 I applied at the County Council work going on at Westminster Bridge, and in November 1893 at the work going on at Bishopsgate fire station, for a job as a painter. I went to Westminster Bridge with a non-union painter. The foreman inquired if we were union men, and, on our both answering 'No,' he said he could not take us on, as they employed none but union men there. About a quarter of an hour afterwards he took on two union men for the job. At the fire brigade station I applied with a union man who had a federation ticket. The foreman asked me if I did not belong to the union, and said they employed none but union men there. The union man was taken on and I was refused; but an hour afterwards I saw a union man taken on, so I knew that if I had had a federation ticket I should have had the job."

The other statements are to practically the same effect.

A deputation from the National Free Labour Association waited upon the works committee of the London County Council on Monday afternoon for the purpose of submitting a statement with reference to the alleged refusal of the Council, or the Council's officials, to employ workmen who could not show the ticket of the Building Trades' Federation. The deputation, which consisted entirely of representatives of the building trade in its various branches, was introduced by Mr. F. J. Roger, hon. treasurer, and Mr. W. Collison, secretary of the Free Labour Association. Mr. Henry Ward, chairman of the works committee, presided, and there was a large

attendance of members. The case for the association as put before the committee was that at the present time an overwhelming majority of the workmen employed by the Council are members of trade unions, and that those non-union men who are in the service of the Council owe their position to the influence of members specially exerted on their behalf. Specific instances of work being refused to men who could not show the ticket of the Building Trades' Federation were given, the instances being in regard to the works at Spring Gardens, the painting of Westminster Bridge, Bishopsgate Street Fire Brigade Station and Victoria Park. Twelve men were in attendance to give evidence on these points, and seven of them were examined individually by the committee. The examination was conducted in private, but it is stated that the committee accepted the men's statements, and a promise was given that the question would be thoroughly investigated. Mr. John Burns, M.P., Mr. Crooks and other labour members of the Council were present, but none of them it is said put any questions to the witnesses. It is stated that until the committee's report is made no action will be taken by the Free Labour Association, but should the report be unfavourable measures will at once be adopted to place the case for free labour before the public.

ELECTRIC LIGHTING IN EDINBURGH.

THE foundation-stone of the Central Electric Station was laid on Monday. About twenty-three miles of mains are to be laid and the Corporation are to light four miles of streets. The cost of the installation is to be about 100,000*l*. A site of about an acre in area was secured for the central station in Torphichen Street, where it has a siding to the Caledonian Railway. This station will have a frontage to Torphichen Street of 200 feet and to Dewar Place of about 150 feet. It is built to accommodate about seventeen boilers—equivalent to 6,000 horse-power—and about a score of engines and dynamos; but until the demand requires it, it is not proposed to put down more than six boilers and six engines and dynamos, which will be sufficient to give an equivalent of 40,000 lamps of eight candle-power. In the hands of the committee the scheme has grown considerably beyond its original dimensions. Mainly in connection with the lighting of streets the committee have gone a good way beyond the compulsory area, and this part of the scheme will, it is believed, be on a larger scale than prevails in

ESTABLISHED 1860.

any city in the kingdom except London and perhaps London-derry.

Professor Kennedy, of London, as consulting engineer, in April of last year submitted a scheme for lighting the compulsory area on the low tension three-wire system, with provision for lighting the suburbs with a high tension system. The preliminary estimate for carrying out this scheme was 85,000*l.*—this sum not including the cost of the station and site—and the income at the end of three years was put down at 17,100*l.*, when it was estimated that about 40,000 lamps would have been wired.

In the evening, at the Albert Hall, Professor Kennedy delivered a popular lecture on the subject of the "Electric Light in Edinburgh." He explained generally the means of generating electrical energy, and making it available for use, and emphasised the fact that the dynamo did not make electricity; it only delivered it under pressure. In explaining the difference between the glow lamp and the arc lamp, and showing how the latter was the cheaper where very large quantities of light were wanted, he mentioned that four miles of the public streets would be lit with arc lamps, having an effective illuminating power of 600 to 700 candles each. In Princes Street the candle-power would be stronger, and he ventured to think that when Princes Street was lit with electricity it would be as fine a street under that light as it was in the daylight. Having explained the method of sending the electricity throughout the city by means of feeding and distributing mains, and having described the different sorts of mains which would be used, the means taken to insulate them, and to lay them in the street, he went on to discuss the subject of the cost of the electric light. In Edinburgh the highest charge for current would be 6*d* per Board of Trade unit. The lamps would cost 1*s.* 3*d.* each. In these circumstances the cost would be about a seventh of a penny per hour for an eight candle-power lamp, and a farthing per hour for a sixteen candle-power lamp. Each glow-lamp would last five hundred or six hundred hours, giving effective light, so that in a private house, with gas at the present price, electric light ought not to cost more than gas. This estimate, however, did not apply if the house was so wired that two or three lights had to be turned on when only one was required, or if the switches were so placed that it was inconvenient to get at them in the dark, or if the mistress of the house thought the wire in the lamp was a detestable thing, and insisted on covering the lamp with an ornament which

absorbed an effective part of the light. The lecture was illustrated with lantern slides, and three of these slides represented views taken from photographs of the ceremony of laying the foundation-stone of the central station in the afternoon.

MANCHESTER AND LEEDS.

THE annual meeting of the Incorporated Association of Municipal and County Engineers was held at Westminster, under the presidency of Mr. A. M. Fowler, C.E., who congratulated the association on having attained its majority, and reviewed the advances that has been made in engineering and sanitary science during the past twenty-one years. Among the things yet to be carried out, however, he advocated the provision of free public open-air baths; the heating of blocks of cottage property by hot air from a central station, and a supply of hot water by similar means; public shelters in different localities for the poor and desolate, &c. He referred at length to the various works which had been carried out in Manchester and Leeds, with both of which towns he had been officially connected; and, speaking of the improvements which had taken place in connection with locomotion, said that he remembered travelling up by four-horse coach with the mails from Leeds to London, the distance of 186 miles taking 26 hours, whereas the journey was now accomplished in four hours. He pointed out how, in Manchester, Leeds and Salford, street improvements had been carried out without additional cost to the ratepayers, and especially referred to the Boar Lane improvements at Leeds, where the price of vacant land adjoining, which was taken by the Corporation, was raised from 3*l.* per square yard to 6*l.*, so that the town was not called upon for any increase in the rates. The acquirement of parks and open spaces (amongst others the Roundhay Park at Leeds) was dealt with, and a description given of the gigantic undertakings of Manchester, in relation to the provision of hydraulic power, electric light, and the water supply. The Thirlmere scheme, he said, would this year be completed, when from the two sources of Thirlmere and Longendale the city would have a supply of 45 million gallons per day. The water was of the highest possible standard, containing only 7 deg. of hardness, which was 15 deg. softer than that of London water. The saving in soap and labour to Manchester, he calculated, amounted to upwards of 300,000*l.* per year, and

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London and Contractor.

THE MOST PERFECT AND RELIABLE SYSTEM OF

VENTILATION AND HEATING FOR SCHOOLS, AND EVERY CLASS OF BUILDING.

The air of Class-rooms renewed every six minutes in all weathers positively and without draughts, no foul air anywhere; for a school of 1,000 68 tons weight of air impellen into it every hour. All buildings ventilated and warmed mechanically. No failures nor breakdowns.

if London had such a supply their saving would be upwards of 2,250,000l. per year. Speaking of the Ship Canal, he said that this year Manchester had had the crown of success added to its achievements by having a highway opened out to the sea. As they were aware, this had become of late years a municipal work, as the Corporation of Manchester now represented more than half the board of directors, and had provided the large sum of 5,000,000l. of the company's capital of 8,000,000l. to enable the undertaking to be completed. That appeared to be an enormous sum for a municipality to advance, and was unprecedented; but when they reflected upon the many great schemes and undertakings which the city of Manchester had entered into they might all be said to be unprecedented. Although the canal itself at present was not in that flourishing condition expected of it from the prospectus, &c., issued on its promotion, yet as a municipal undertaking it had no doubt already paid the inhabitants of Manchester, inasmuch as the reduction of the railway freights between Liverpool and Manchester since its commencement of the shipping at present carried on (although limited) was a great boon to the city. Among other matters referred to was the treatment of sewage, in regard to which he said Leeds had spent 10,000l. in experimenting and on structural works before laying down the permanent plant for the treatment of about 10 million gallons of sewage daily before entering the river.

HAZELAND'S WOOD-PLANING MACHINE.

ON Thursday, the 21st inst., a petition for a prolongation of the letters patent, dated July 10, 1880, No. 2848, granted to Samuel Searle Hazeland, of Par, Cornwall, machinist, came on for hearing before the Judicial Committee of the Privy Council (present Lord Watson, Lord Hobhouse, Sir Richard Couch and the Right Hon. George Denman). The invention relates to the use of a simple and inexpensive machine for planing all kinds of woodwork boards for confectionery and cigar-boxes, floor boards, stair steps and packing cases of every description.

In his petition, Mr. Hazeland alleged that the machine had been applied with very great and most marked practical success in London, Lancashire, Yorkshire, Leicestershire and a large number of places in England and other parts of the United Kingdom, that he had given much time and labour to and expended very considerable sums of money in experiments upon

and in perfecting his said invention, to do which he had had to give up his venetian blind manufactory, that he had granted licenses to make his invention at a royalty, among others to Messrs. W. B. Haigh & Co., Limited, of Oldham; Mr. George Lines, of Bootle; and Messrs. Thomas Robinson & Son, Limited, of Rochdale, and, that notwithstanding the sums he had received from his licenses, he had been insufficiently remunerated, and that he had, in fact, made a loss.

From the accounts produced, it appeared that the patentee had received during the fourteen years royalties amounting to 976l. 15s. 2d., the sale prices of the machines (ranging from 10l. to 80l.) amounting to 7,816l. 2s. 5d., and that, adding his expenditure and the value of his personal services to the patent fees of 189l. 13s., a considerable loss had been incurred.

Mr. H. B. Hans Hamilton (instructed by Mr. E. Heys Jones, of 5 John Street, Bedford Row, W.C.) appeared for the petitioner, and Mr. Sutton (with him Sir John Rigby, Q.C., Attorney-General) appeared for the Crown.

Mr. Hans Hamilton, after shortly reciting the facts of the case, called Mr. Hazeland, who bore out counsel's opening and the statements in the petition and accounts, and he also explained to the committee from a model the merit of his invention—a simple roller with a thick rubber tyre placed immediately over the planing knife, acting both as a feeder and presser in place of the numerous rollers and cogs in other planing machines, these rollers and cogs hitherto having been used only for pressing the wood upon the knife, the feeding being effected by separate action.

Mr. David House, engineer to Messrs. A. Bridgman & Co., Limited, box and packing-case makers, City Road Bridge, E.C., spoke to the novelty and ingenuity of the invention. He said that if the machine could be fed quickly about 1,400 feet of wood could be planed per minute, but owing to the time taken in feeding the machine, they could only turn out about 700 feet per minute. They had five machines in use, and did not know anything to equal them. The machine in constant use lasted a great number of years.

Their lordships, Mr. Sutton not objecting, said they were satisfied with the accounts, and would not require evidence thereon. Other evidence was called, and it was shown that the machine had been a great boon to the trade, and there was nothing at present so cheap and so good in the market.

Their lordships decided to advise her Majesty to grant a prolongation of Mr. Hazeland's letters patent for a further term of seven years.

THE LATE JOHN REID.

THE death is announced of the Lord Dean of Glasgow Guild Court, which occurred suddenly. Mr. Reid was a native of Auchterarder, Perthshire, and is styled by the *Glasgow Herald* as one of their foremost captains of industry. As in the case of many men who have risen to like positions, he was the architect of his own ample fortune. He was born in the parish of Kilmaurs in September 1822, and such education as he received was got at the village school. At the outset of his career he was engaged as a blacksmith's assistant, under more than one employer. Ultimately he went to Greenock, beginning with Messrs. Scott, Sinclair & Co., and being employed afterwards by Messrs. Caird & Co. as an engineer. He had a natural taste for drawing and some knowledge of the art, and an injury to one of his eyes led to his transference from the practical department to the drawing-office. There he displayed such ability and aptitude that he rose to the position of chief draughtsman in 1850. When in his thirtieth year he came to be manager at Hyde Park Locomotive Works, which then occupied their original position in Anderston. Here he remained for some years, extending his knowledge and experience. Subsequently he removed to Manchester, having received a similar appointment as manager of the locomotive Works of Messrs. Sharp, Stewart & Co. In 1863 the late Mr. Henry Dubs retired from the management of the Hyde Park Works to start the Glasgow Locomotive Works at Polmadie. Mr. Montgomerie Neilson had some time previously entered into correspondence with his former manager, with the result that Mr. Reid returned to Glasgow as managing partner of the firm of Messrs. Neilson & Co. During his absence the Hyde Park Works had been transferred to Springburn—the actual date of removal was the year 1860. Mr. Neilson was at the time in failing health, and the burden of the work fell upon Mr. Reid. But it was wholly congenial, he threw himself into it with his whole heart, and the business began rapidly to extend. As an indication of the progress which has been made, it may be mentioned that in 1863 about 1,000 men were employed, and the number of engines turned out was seventy-eight annually; lately the number of the hands had increased to about 2,600, and the output to 200 locomotives a year, Hyde Park being the largest

locomotive establishment in private hands in the United Kingdom. Mr. Reid's original agreement with Mr. Montgomerie Neilson was for a period of ten years. At its expiry a new arrangement was made, giving Mr. Reid the option of purchase. This power he exercised in the year 1876, and from that date until last year, when the membership of the firm was extended by the assumption of his four sons, Messrs. Hugh, John, Andrew, and Walter, he was the sole proprietor of the work.

The life of Mr. Reid may be said to have been co-extensive with the locomotive industry, and to this fact in some measure was due the supreme position he attained. But he had native qualities which made for success. He was a man of sterling integrity, iron will, indomitable perseverance, and of the most methodical business habits. For many years after he came to Hyde Park as managing partner he was in the works as punctually on the stroke of six o'clock as any of his men, while his work-day often extended till late into the night. Many men had a greater amount of scientific and theoretical knowledge, but Mr. Reid had the faculty of seeing instinctively the means of obtaining a desired result. His instructions were given with promptness and decision, and he seldom made a mistake, though in all cases he imperatively insisted on his orders being obeyed. He had great experience, firmness and tact in the management of men, and there has rarely been a dispute in the Hyde Park Works. But he was no believer in modern ideas, nor was his view a late growth. He was wont to tell of an experience in his early life, when a fellow-workman found fault with him for doing too much work, declaring that he would soon find himself out of a job. The reply of the youth was that he meant to do his work as well as he could, to do as much as he could, and that he would brook interference on the part of no man. The incident was characteristic of the man throughout his long and useful life.

Absorbed in the management of his own establishment and in the extension and perfecting of all its details, Mr. Reid was for many years unable to give much of his time or attention to public affairs, but his interests were largely bound up with the district of Springburn, and in the year 1877 he was induced to enter the Council as member for the Third Ward. He remained in office for the full term of three years, and was a most useful member. He took little part in the public discussions, but in committee he gave valuable advice in practical matters, readily placing at the service of the community his wide and varied experience. Last November Mr. Reid again

Stone and Wood Work. 37 King Street, Derby.

returned to the Town Council. On this occasion he was sent as Lord Dean of Guild by the Merchants' House, of which body he had long been a member. He was for a period of years a member of the Springburn School Board, and for a time held office as chairman. In all matters connected with Springburn he took a lively interest, and recently he made a gift of a bandstand for the new public park.

Mr. Reid was a generous patron of the fine arts and filled the position of president of the Fine Art Institute. He was president of the Institution of Engineers and Shipbuilders, a member of the Institution of Civil Engineers, chairman of the Tramway Company, and a Justice of the Peace for the counties of Lanark and Perth.

DELAYS IN BUILDING PARTY WALLS.

IN the Court of Appeal on the 22nd inst. an important case—*Jolliffe v. Woodhouse*—relating to party walls was heard before the Lords Justices. The plaintiff was tenant from year to year of No. 17 Coronet Street, Hoxton, where he carried on business as a fish salesman. The defendant was the owner of the adjoining house, No. 19. Towards the end of 1891, or the beginning of 1892, the defendant pulled down his house with the intention of rebuilding it, and it was found that the party wall between Nos. 19 and 17 was not strong enough to support the new building. The defendant accordingly served notice upon the plaintiff under the Metropolitan Building Act, 1855, of his intention to pull down the party wall. The defendant began to pull down the wall on February 16, 1892. Thereupon the plaintiff on February 17 issued the writ in this action for an injunction to restrain the defendant, his architect, builders, surveyors or servants from interfering with the party wall or in any way hindering the plaintiff from carrying on his business or rendering his house uninhabitable. The rebuilding was completed in August 1892. The trial of the action was commenced before Mr. Justice Bruce in April 1893, the defence being that the acts complained of were done under the powers of the Metropolitan Building Act, 1855. The plaintiff then sought to make out that the defendant had exceeded his powers under the statute, and an order was made by consent directing the action to stand over to enable the plaintiff to give particulars of alleged acts of excess of statute. The plaintiff duly delivered particulars under this order, from which it appeared that the main complaint was that the defendant had allowed an unreasonable time to elapse before the completion of the re-

building. In May 1894 the action was tried before Mr. Justice Grantham and a common jury, and leave was obtained by the plaintiff to amend his statement of claim so as to raise the issue of delay in the rebuilding. The jury found a verdict for the plaintiff, damages 40*l.*, and judgment was entered accordingly. The defendant now applied for a new trial on the ground of misdirection. The points which he mainly relied on were two—first, that the judge ought not to have allowed the claim to be amended, inasmuch as the cause of action had arisen since the writ, and secondly, that inasmuch as the defendant had provided a competent architect and builder he was not responsible to the plaintiff for the delay caused by their negligence.

The Court, without calling upon counsel for the plaintiff, refused the application.

Lord Justice Lindley said that it was contended that the judge had no power to amend so as to give to the plaintiff in this action any relief in respect of injuries sustained after the issue of the writ. But that point was clearly waived by the defendant by the consent order, and even apart from that order his lordship was not satisfied that the judge had no power to allow the amendment under the circumstances. Then it was said that the defendant was not liable for the injury caused by the delay in rebuilding, because he had employed a proper architect and a proper builder, and that they were responsible for the negligence, if any, which gave rise to the delay. That contention was founded on a mistake. A person who sought to knock down a party wall for the purpose of rebuilding it had a right to do so both at common law and by statute, but it was his duty to rebuild it with reasonable despatch. Here the plaintiff had a cause of action against the defendant for the breach of that duty, and it was no answer to say that the defendant had delegated that duty to his builder or architect. A man could not delegate a duty, and the class of cases in which an employer who had engaged a competent contractor was held not liable for the negligence of the contractor had no application. The defendant might employ a contractor if he chose, but that did not enable him to get rid of the responsibility for the breach of the duty which he owed to the plaintiff. The application should be refused.

Lord Justice Lopes concurred. *Cubitt v. Porter* decided that an action would not lie against an adjoining owner for pulling down a party wall for the purpose of rebuilding it; but he was bound to do so without causing any unnecessary inconvenience to his neighbour, and without unreasonable delay.

That also appeared from section 85, sub-section 3, of the Metropolitan Building Act, 1855, which provided that no building owner should exercise any right thereby given "in such manner or at such time as to cause unnecessary inconvenience to the adjoining owner." An absolute duty was thrown upon the person knocking down the wall to do so within a reasonable time and in a reasonable manner, and he could not delegate that duty to a contractor.

Lord Justice Davey agreed. The defendant's argument could only be supported by confusing two classes of cases. Where a man owed a duty to his neighbour he could not free himself of that duty by delegating it to another person. Where, on the other hand, a man employed a contractor to do work which, if properly and skilfully done, did not involve any interference with his neighbour's rights, but an injury had been caused by the negligence of the contractor, then it might be that the employer would not be liable if he employed a competent contractor. Here the defendant had a statutory and common-law licence to take down this party wall, subject to the duty of using reasonable despatch, and when he employed a contractor to do the work he took upon himself the responsibility of seeing that that duty was adequately performed.
